RedBUILT™

Open-Web Trusses

Including Red-L,™ Red-W,™ Red-S,™ Red-M™ and Red-H™ Trusses

- Outstanding Strength-to-Weight Performance
- Easy Installation
- Custom Manufacturing
- Design Flexibility
- Economical Truss Solutions
- Limited Product Warranty

RedSPEC™ Product Sizing Software

Download your free copy at RedBuilt.com.

Specify Open-Web trusses for your next project using RedSpec™ single-member sizing software.

TABLE OF CONTENTS

Welcome to RedBuilt

RedBuilt is an exciting business offering building solutions for a broad range of commercial and custom residential applications. In addition to pioneering unique manufacturing technologies, RedBuilt provides world-class service and technical support for architects, specifiers and builders.

RedBuilt gives you access to reliable, innovative products, including RedBuilt™ open-web trusses, Red-I™ joists, and RedLam™ LVL beams and headers. And we keep things simple: You'll work with just one service-oriented supplier to get all these products—plus the support you need to build smarter.

RedBuilt: A family of brand-name building products... a source for innovative ideas and solutions... a supplier that's simpler to do business with.

ABOUT THIS GUIDE

The RedBuilt™ Open-Web Truss Specifier's Guide is one of several guides that offer technical information and design recommendations for RedBuilt™ products. This guide provides architects, designers, and engineers with information regarding open-web trusses for commercial and custom residential applications.

Product Selection

This guide provides specifiers with technical information about the RedBuilt™ open-web truss product line. However, complex or custom applications can often make specifying the right products in the right places a challenge—especially when you have factors such as span, wind or load-carrying capacity and other design constraints to consider. But whatever your project entails, RedBuilt is here to help. Your local RedBuilt technical representative, along with our Design Center teams, can assist you in choosing the best products and designing the best system for your specific application.

Contact us for help with any of the following:

- Product selection
- Building department calculations
- Complete cost analysis
- System selection (system packages can include horizontal framing, main carrying beams, headers, wall framing, mansard framing, and accessories)

Products for Every Application

In addition to open-web trusses, RedBuilt offers a variety of other engineered lumber products that are ideal for use in commercial and custom residential projects. For more information, contact your RedBuilt technical representative or visit redbuilt.com to download literature for products such as Red-I™ joists and RedLam™ LVL.

Unsurpassed Technical Support

RedBuilt has one of the largest networks of technical representatives in the business. Their services include consultation, computer-assisted design and layout, delivery coordination, and installation review. They can suggest cost-reduction techniques and check special application requirements. In addition, they're backed by a staff of professional engineers who provide comprehensive technical support when needed. Special requests are accommodated wherever practical, and they offer cost analysis, engineering analysis, assistance with building code approvals—even the creation of special product applications for more creative designs. The goal of RedBuilt technical support is to help architects and engineers achieve quality design applications with the most cost-efficient product selection possible.

Our network of technical representatives offers a wide range of services to help guide your projects through planning and construction.

Resource Efficiency

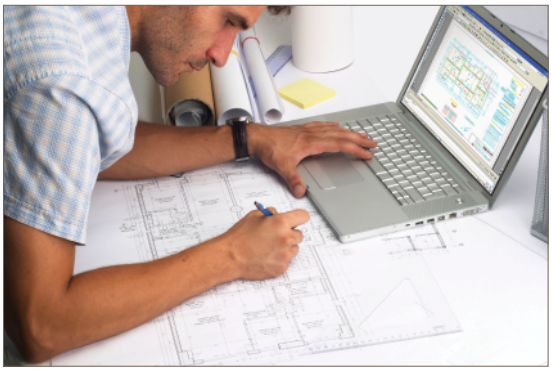
Consider all of the positive attributes of wood when selecting your building material of choice. In addition to its structural properties, high strength-to-weight ratio, and ease of construction, wood is a naturally occurring, renewable resource that requires less energy to produce than steel or concrete. And it sequesters carbon—whether on the stump or in your structure.

Our RedBuilt™ open-web trusses with RedLam™ LVL chords, as well as other RedBuilt™ products, are made with responsibly sourced fiber. Whether you're looking for LEED® certification or simply want to ensure efficient use of raw materials, we can help. By making better use of every tree, RedBuilt produces cost-effective, consistently available engineered wood products that reduce environmental impact. The result is a quality wood product that offers superior strength and reliable performance.

DESIGN CENTER SERVICES

Upon request, RedBuilt can provide the following services for the products described in this Open-Web Truss Specifier's Guide:

- A complete design package including layout drawings (placement diagrams) and detailed design calculations.
- Review and analysis of the application.
- Drawings or calculations sealed by a professional engineer.



Our technical support team offers professional capabilities in the design and application of all RedBuilt™ products.

Installation Review

Although responsibility for proper installation lies with the contractor-builder, RedBuilt provides detailed suggestions and guidelines for installation. If requested, a RedBuilt representative will visit the site to verify the contractor's understanding of proper installation. RedBuilt professional engineers also are available to help solve jobsite application problems.

Engineering Responsibility Position Statement

RedBuilt is a manufacturer of proprietary structural components.

It employs a staff of professional engineers to aid in the development, manufacture, and marketing of its products. RedBuilt does not replace or accept the responsibility of the design professional of record for any structure.

RedBuilt accepts the delegation of engineering responsibility only for the products it manufactures, provided that the application conditions are specified by the design professional of record, or other responsible party when a design professional is not engaged. RedBuilt provides engineering in the design of its products and does not displace the need on any project for a design professional of record.

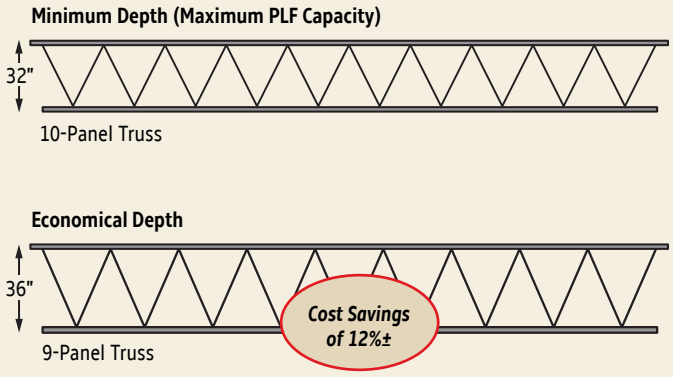
HOW TO SPECIFY TRUSSES FOR MAXIMUM ECONOMY

It is in the designer's best interest to specify the most economically efficient materials and ensure that their customers are not paying extra for structural components that are oversized for the given loads. However, specifying a minimum depth truss with the maximum plf loading (as shown in the load tables on pages 6–11) may not be the most economical solution.

Designing to the maximum depth allowed for the application, and not maximizing loads in tables, will produce the most economical solution. Keep this and the following two examples in mind when consulting the load tables in this guide:

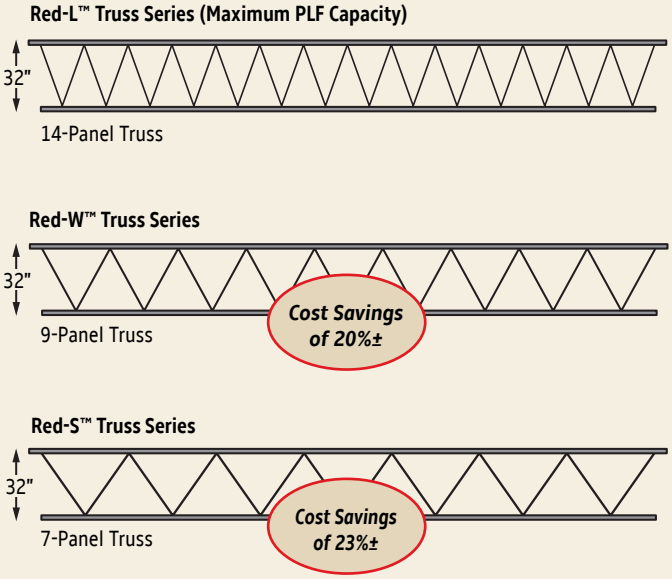
Deeper Can Be More Economical

Example:



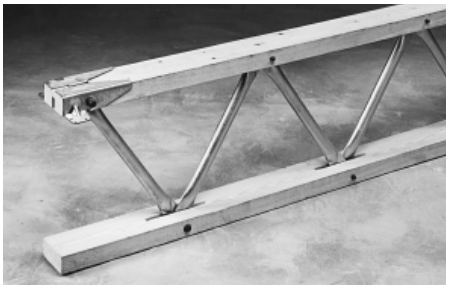
Consider An Alternative Truss Series

Example:



Top chord bearing at each end provides the easiest installation and the most cost-effective truss system. Note that these are general guidelines only and they are not reflective of all applications. Consult your local RedBuilt technical representative to assist you in specifying the most economical truss solutions for your particular applications.

OPEN-WEB TRUSS DESCRIPTIONS



Red-L™ and Red-W™ Trusses

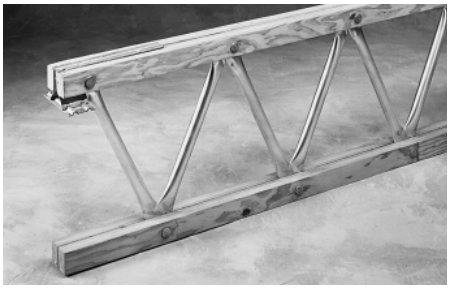
Chords:
- Red-L™ trusses: 1½" x 3½" MSR lumber*
- Red-W™ trusses: 1½" x 4¾" MSR lumber

Webs:
1" and 1⅛" diameter tubular steel members varying in gauge and diameter according to requirements.

Weight:
- Red-L™ trusses: 3.75 to 4.25 lbs/ft
- Red-W™ trusses: 4.5 to 5.25 lbs/ft

Depths:
Minimum depth at wall .....14"
Maximum depth at wall .....50"
Maximum pitched ridge depth.....50"

Any depth between minimum and maximum is available.



Red-S™ Trusses

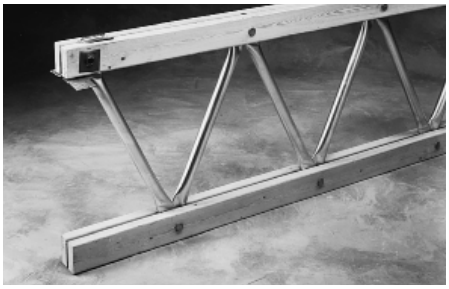
Chords:
Double 1½" x 2.3" RedLam™ LVL

Webs:
1", 1¼", and 1½" diameter tubular steel members varying in gauge and diameter according to requirements.

Weight:
4.75 to 5.75 lbs/ft

Depths:
Minimum depth at wall .....16"
Maximum depth at wall .....60"
Maximum pitched ridge depth.....84"

Any depth between minimum and maximum is available.



Red-M™ and Red-H™ Trusses

Chords:
- Red-M™ trusses: Double 1½" x 3½" MSR lumber*
- Red-H™ trusses: Double 1½" x 5½" MSR lumber*

Webs:
Up to 2" diameter tubular steel members varying in gauge and diameter according to requirements.

Weight:
- Red-M™ trusses: 8 to 9 lbs/ft
- Red-H™ trusses: 10 to 12 lbs/ft

Depths:	**Red-M™**	**Red-H™**
Minimum depth at wall	20"	24"
Maximum depth at wall	60"	72"
Maximum pitched ridge depth	72"	114"

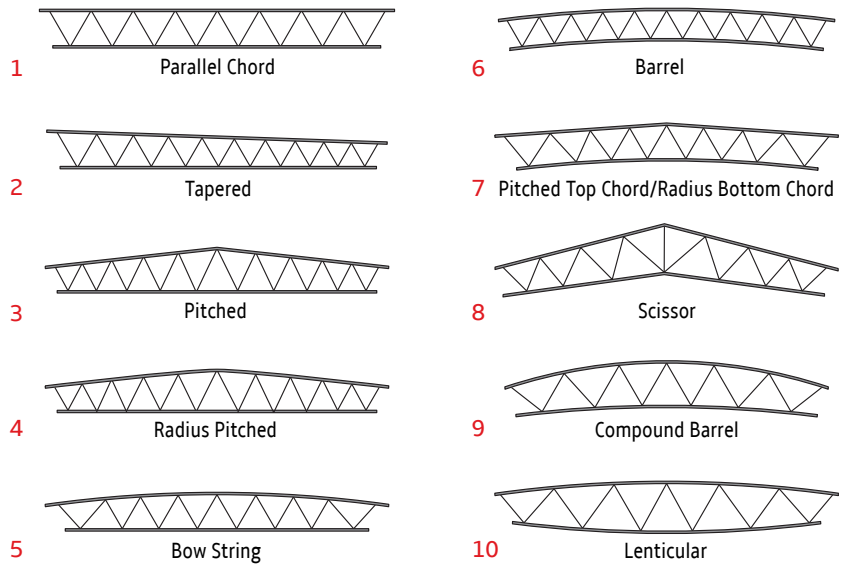
Any depth between minimum and maximum is available.

Open-web trusses are intended for dry use, untreated applications.

* RedLam™ LVL chords may be available for Red-L,™ Red-M,™ and Red-H™ truss series. Consult your technical representative for availability and limitations.

Building Codes and Product Acceptance: See ICC-ES ESR-1774, L.A. City RR #22614

Truss Profiles



Tightest Curvature Available:

Red-L™ and Red-W™ trusses .....52' radius
Red-S™ trusses .....200' radius
Red-M™ trusses..... Camber only
Red-H™ trusses ..... Camber only

Truss Series	Profiles Available									
	1	2	3	4	5	6	7	8	9	10
Red-L™ Red-W™	⊠	⊠	⊠	⊠	⊠	⊠	⊠	⊠	⊠	⊠
Red-S™	⊠	⊠	⊠	⊠	⊠	⊠	⊠	⊠	⊠	⊠
Red-M™	⊠	⊠	⊠					⊠		
Red-H™	⊠	⊠	⊠					⊠		

⊠ Indicates that the profile is available.

In radius truss applications (Profiles 5, 6, 7, 9, and 10), allowable loads are reduced due to radial stresses. Contact your RedBuilt technical representative for job-specific possibilities.

Maximum top chord slope for Profile 4 (Radius Pitched) is ½:12 for Red-L™ and Red-W™ truss series, and ⅜:12 for Red-S™ truss series.

RED-L™ TRUSS ALLOWABLE UNIFORM LOAD TABLE (PLF) / PARALLEL CHORD

- See page 5 for available depths and profiles. For depths and profiles not shown, contact your RedBuilt technical representative for assistance.
- Red numbers refer to 115% Total Load (TL).

General Notes

- **Values shown demonstrate maximum allowable load capacities based on the following assumptions:**
  - Simple span, uniformly loaded conditions, with provisions for positive drainage (¼:12 slope, minimum) in roof applications.
  - **Span** indicates distance from inside face to inside face of bearing.
  - Top chord no-notch bearing clips with 1¾" bearing. Higher values may be possible with other types of bearing clips.
- Straight line interpolations may be made between depths and spans.
- Values in shaded areas may be increased 7% for repetitive-member use.
- ***Bold italic*** values are controlled by minimum concentrated load analysis of 2,000 lbs. Higher loads are possible where minimum concentrated load analysis is not required by code. Contact your RedBuilt technical representative for assistance.

General Notes continued on page 7

Trusses delivered to the jobsite are custom manufactured to resist only project specific application loads provided by the design professional. Actual trusses may not be able to resist the maximum loads shown in the tables above. For questions regarding actual truss capacity contact your RedBuilt technical representative.

- See page 5 for available depths and profiles. For depths and profiles not shown, contact your RedBuilt technical representative for assistance.
- Red numbers refer to 115% Total Load (TL).

General Notes continued from page 6

To size floor trusses:
Check both total load (100% TL) and live load (100% LL). When live load is not shown, total load will control. Total load values limit deflection to L/240. Live load values are based on the **Commercial Floor Deflection Limit** shown on page 35, and assume a nailed floor system. Live load (100% LL) values may be increased with a glue-nailed floor system; contact your RedBuilt technical representative for assistance.

To size roof trusses:
Check the appropriate snow load area (115% TL) or non-snow load area (125% TL) value to determine the maximum allowable total load. Total load (115% TL and 125% TL) values limit truss deflection to L/180.

Consult local codes to verify deflection limits required for specific applications.

Trusses delivered to the jobsite are custom manufactured to resist only project specific application loads provided by the design professional. Actual trusses may not be able to resist the maximum loads shown in the tables above. For questions regarding actual truss capacity contact your RedBuilt technical representative.

- See page 5 for available depths and profiles. For depths and profiles not shown, contact your RedBuilt technical representative for assistance.
- Red numbers refer to 115% Total Load (TL).

General Notes

- **Values shown demonstrate maximum allowable load capacities based on the following assumptions:**
  - Simple span, uniformly loaded conditions, with provisions for positive drainage (¼:12 slope, minimum) in roof applications.
  - **Span** indicates distance from inside face to inside face of bearing.
  - Top chord no-notch bearing clips with 2¾" bearing for Red-W™ trusses and standard bearing clips for Red-S™ trusses. Higher values may be possible with other types of bearing clips.
- Straight line interpolations may be made between depths and spans.
- Values in shaded areas may be increased for repetitive-member use as follows: 7% for Red-W™ trusses and 4% for Red-S™ trusses.
- ***Bold italic*** values are controlled by minimum concentrated load analysis of 2,000 lbs. Higher loads are possible where minimum concentrated load analysis is not required by code. Contact your RedBuilt technical representative for assistance.

General Notes continued on page 9

Trusses delivered to the jobsite are custom manufactured to resist only project specific application loads provided by the design professional. Actual trusses may not be able to resist the maximum loads shown in the tables above. For questions regarding actual truss capacity contact your RedBuilt technical representative.

RED-S™ TRUSS ALLOWABLE UNIFORM LOAD TABLE (PLF) / PARALLEL CHORD

- See page 5 for available depths and profiles. For depths and profiles not shown, contact your RedBuilt technical representative for assistance.
- Red numbers refer to 115% Total Load (TL).

General Notes continued from page 8

To size floor trusses:
Check both total load (100% TL) and live load (100% LL). When live load is not shown, total load will control. Total load values limit deflection to L/240. Live load values are based on the **Commercial Floor Deflection Limit** shown on page 35, and assume a nailed floor system. Live load (100% LL) values may be increased with a glue-nailed floor system; contact your RedBuilt technical representative for assistance.

To size roof trusses:
Check the appropriate snow load area (115% TL) or non-snow load area (125% TL) value to determine the maximum allowable total load. Total load (115% TL and 125% TL) values limit truss deflection to L/180.

Consult local codes to verify deflection limits required for specific applications.

Trusses delivered to the jobsite are custom manufactured to resist only project specific application loads provided by the design professional. Actual trusses may not be able to resist the maximum loads shown in the tables above. For questions regarding actual truss capacity contact your RedBuilt technical representative.

RED-M™ TRUSS ALLOWABLE UNIFORM LOAD TABLE (PLF) / PARALLEL CHORD

- See page 5 for available depths and profiles. For depths and profiles not shown, contact your RedBuilt technical representative for assistance.
- For spans over 70 feet, see page 32 or contact your RedBuilt technical representative.
- Red numbers refer to 115% Total Load (TL).

General Notes

- **Values shown demonstrate maximum allowable load capacities based on the following assumptions:**
  - Simple span, uniformly loaded conditions, with provisions for positive drainage (¼:12 slope, minimum) in roof applications.
  - **Span** indicates distance from inside face to inside face of bearing.
  - Top chord **Z** bearing clips for Red-M™ and Red-H™ trusses. Higher values may be possible with other types of bearing clips.
- Straight line interpolations may be made between depths and spans.
- ***Bold italic*** values are controlled by minimum concentrated load analysis of 2,000 lbs. Higher loads are possible where minimum concentrated load analysis is not required by code. Contact your RedBuilt technical representative for assistance.

General Notes continued on page 11

Trusses delivered to the jobsite are custom manufactured to resist only project specific application loads provided by the design professional. Actual trusses may not be able to resist the maximum loads shown in the tables above. For questions regarding actual truss capacity contact your RedBuilt technical representative.

- See page 5 for available depths and profiles. For depths and profiles not shown, contact your RedBuilt technical representative for assistance.
- For spans over 70 feet, see page 32 or contact your RedBuilt technical representative.
- Red numbers refer to 115% Total Load (TL).

General Notes continued from page 10

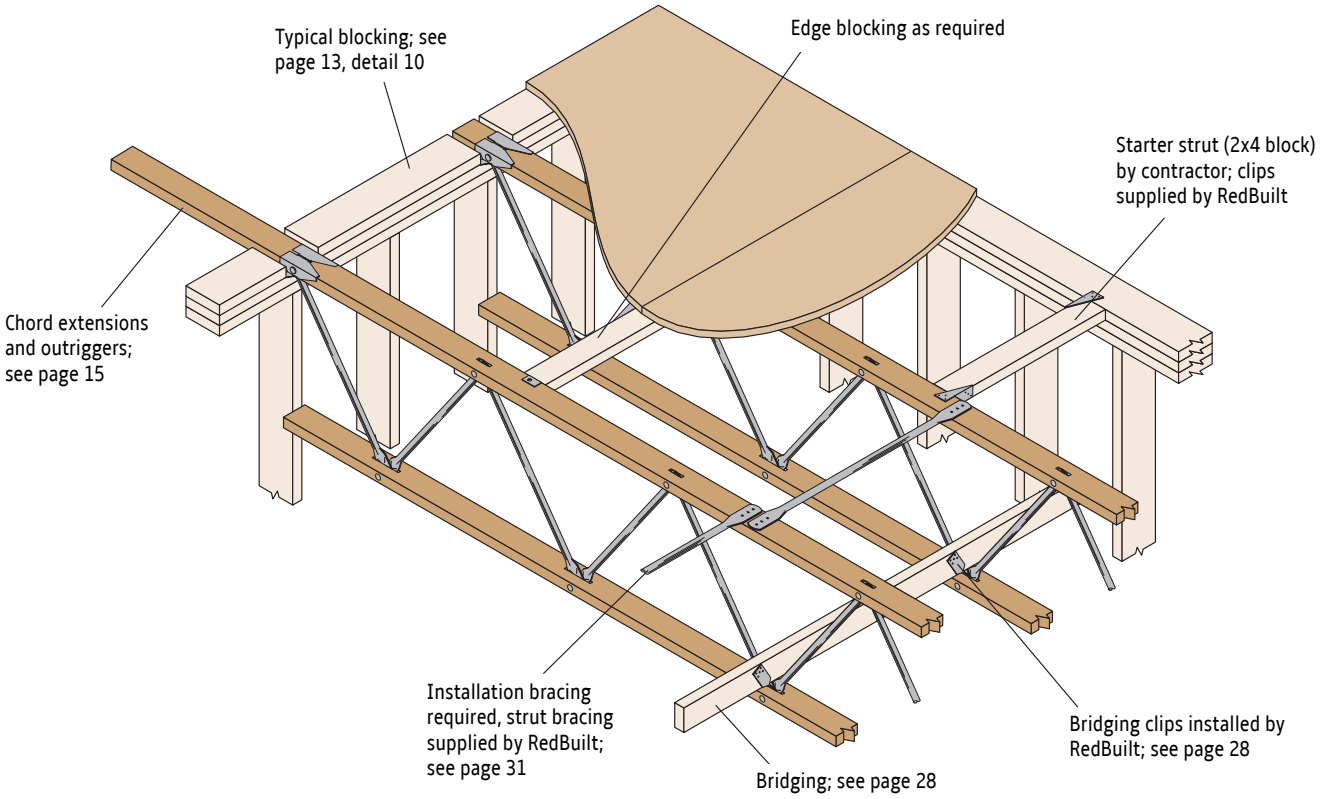
To size floor trusses:
Check both total load (100% TL) and live load (100% LL). When live load is not shown, total load will control. Total load values limit deflection to L/240. Live load values are based on the **Commercial Floor Deflection Limit** shown on page 35, and assume a nailed floor system. Live load (100% LL) values may be increased with a glue-nailed floor system; contact your RedBuilt technical representative for assistance.

To size roof trusses:
Check the appropriate snow load area (115% TL) or non-snow load area (125% TL) value to determine the maximum allowable total load. Total load (115% TL and 125% TL) values limit truss deflection to L/180.

Consult local codes to verify deflection limits required for specific applications.

Trusses delivered to the jobsite are custom manufactured to resist only project specific application loads provided by the design professional. Actual trusses may not be able to resist the maximum loads shown in the tables above. For questions regarding actual truss capacity contact your RedBuilt technical representative.

RED-L™ AND RED-W™ TRUSS DETAILS

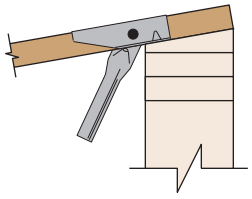


1 Beveled Plate Requirements

Beveled bearing plates are required for trusses with sloped top chords.

Beveled plates serve two functions:

1. Provide proper bearing for the bearing clip.
2. Avoid interference between the top chord and the bearing plate.



A beveled plate, to suit roof slope, is required at all common bearings and cantilevered bearings.

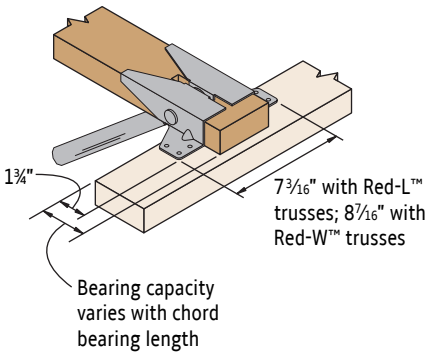
Slopes Requiring a Beveled Plate

Bearing Condition	No-Notch, U-Clip		
	2x8	2x6	2x4
Low end	>¼:12	>⅜:12	>½:12
High end	>⅜:12	>⅜:12	>½:12
Cantilever	Beveled plate required at all slopes		
Common			

- See detail 4 for flush mount bearing clip requirements.

2 Top Bearing

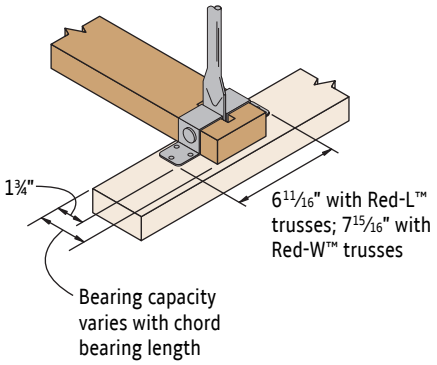
No-Notch Clip



Pre-notched plate not required

3 Bottom Bearing

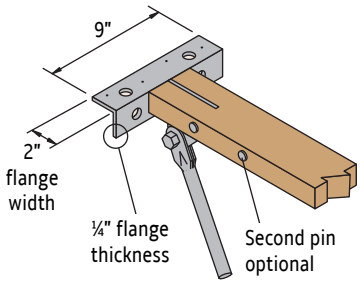
U-Clip



4 Top Bearing

Flush-Mount Clip (Heavy Duty)

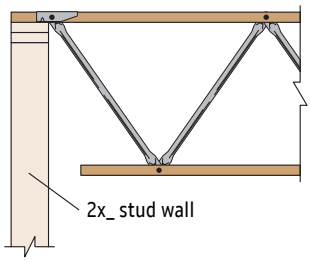
Specify for high axial load applications



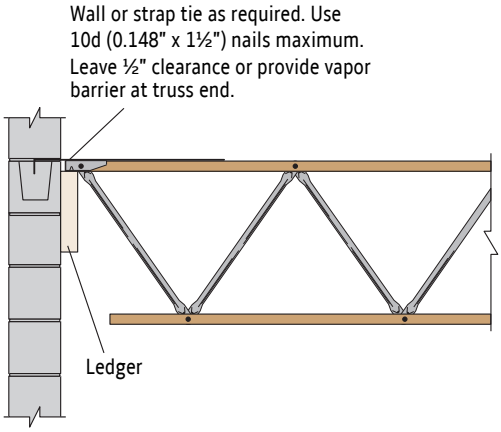
Maximum slope is ½:12. Contact your RedBuilt technical representative for truss depths less than 21". See pages 24–26 for additional information on Wind or Seismic Connections.

See page 22 for bearing reaction capacities

5 Top Chord Bearing
No-Notch Clip

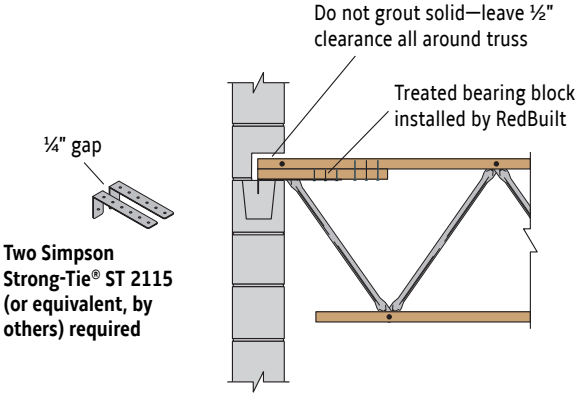


6 Top Chord Bearing on Ledger
No-Notch Clip



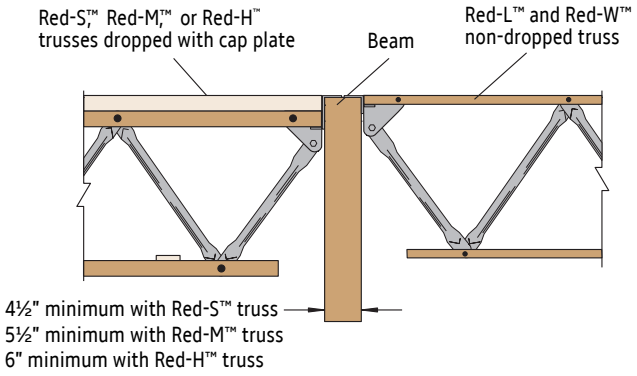
See page 24 for compatible strap ties

7 Bearing Block at Masonry Wall



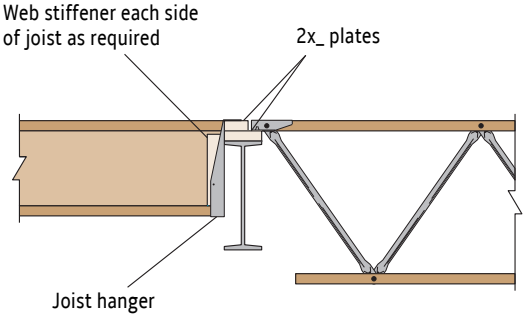
Blocking not shown for clarity

8 Top Chord Bearing
Flush-Mount Bearing Clip (Dropped and Non-Dropped)



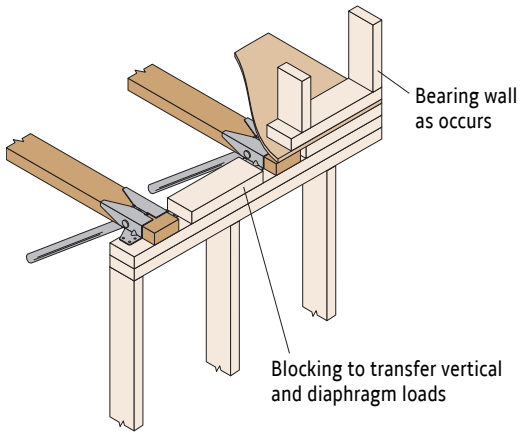
See page 25 for axial tension or compression capacity information

9 Red-I™ Joist Butting with Top Chord Bearing Truss

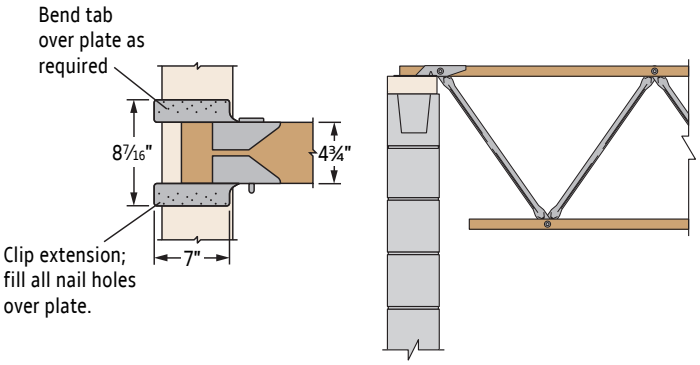


Option: Bearing clips may also be welded directly to steel beam

10 Typical Top Chord Bearing and Blocking
No-Notch Clip

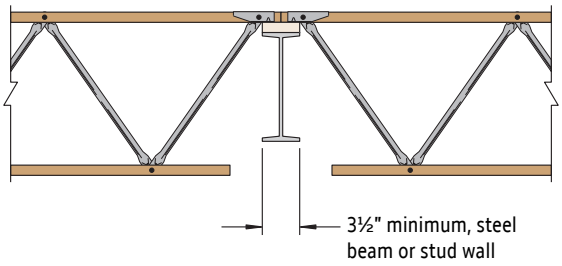


11 Red-W™ Truss Top Chord Bearing
Lateral No-Notch Clip



See page 26 for lateral load capacity and for Red-L™ and Red-W™ alternate detail

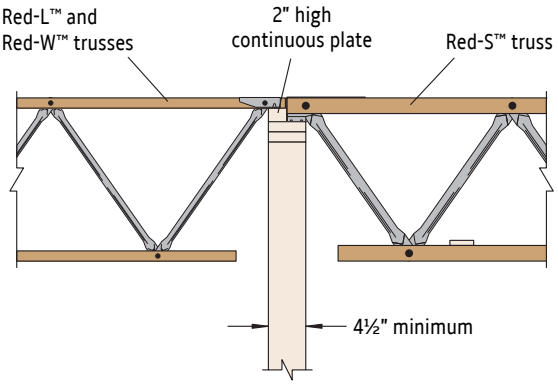
12 Top Chord Bearing on Steel Beam
No-Notch Clip



2,860 lbs reaction capacity at 100% duration of load; higher reactions require more bearing length

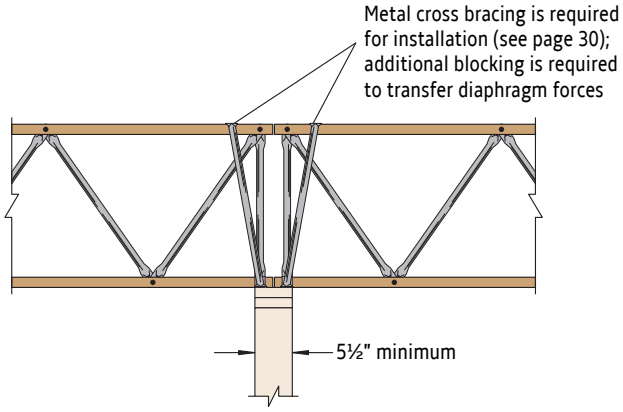
Option: Bearing clips may also be welded directly to steel beam

13 Top Chord Bearing Truss Butting with Red-S™ Truss

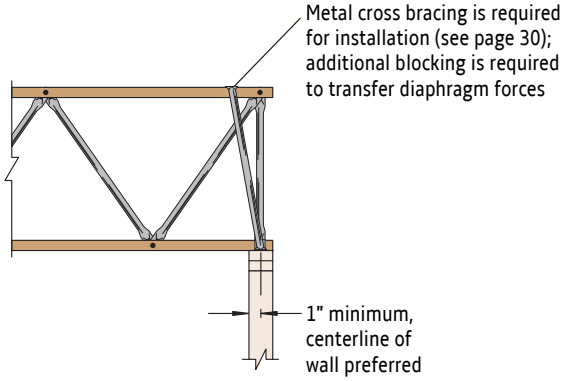


2,860 lbs reaction capacity at 100% duration of load for Red-L™ and Red-W™ trusses; higher reactions require more bearing length

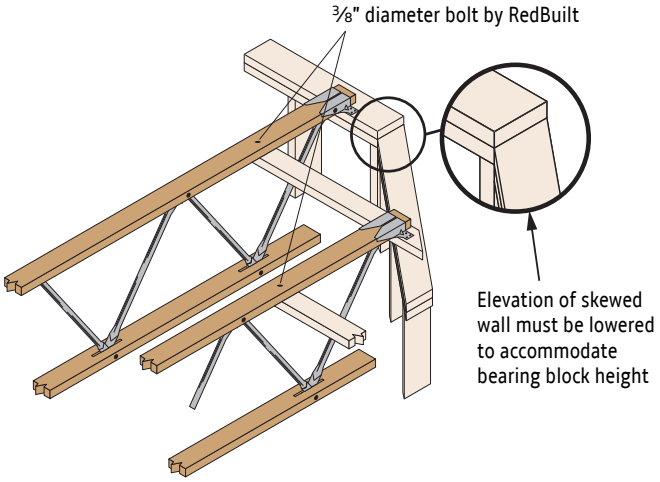
14 Bottom Chord Bearing with Butting Trusses
U-Clip



15 Bottom Chord Bearing with Cross Bracing
U-Clip

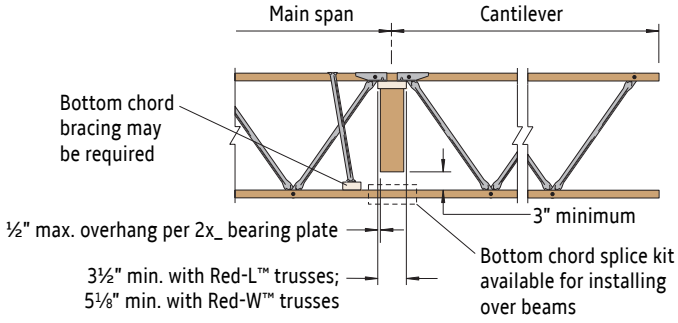


16 Top Chord Bearing at Skewed Wall
No-Notch Clip



17 Top Chord Bearing Cantilever

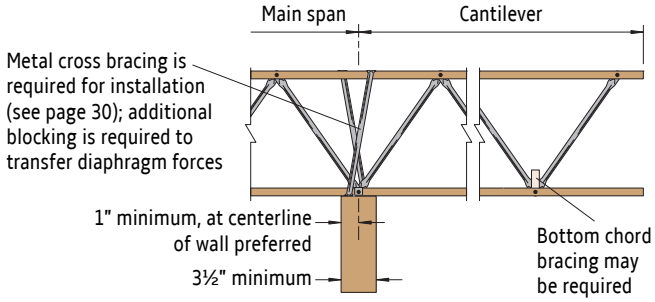
No-Notch Clip



Contact your RedBuilt technical representative if cantilever exceeds ⅓ of main span

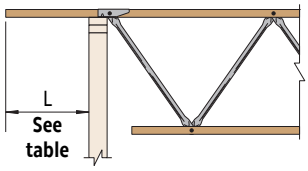
18 Bottom Chord Bearing Cantilever

U-Clip



Contact your RedBuilt technical representative if cantilever exceeds ⅓ of main span

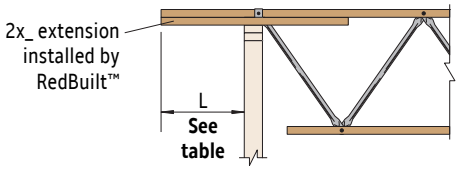
19 Top Chord Extension



Length L	Allowable Uniform Load Capacity (plf)					
	Red-L™ Trusses			Red-W™ Trusses		
	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)
10"	375	425	460	455	500	515
12"	375	425	460	455	500	515
14"				455	500	515
16"				390	465	470
18"				275	330	330

- Values are limited by the published backspan capacity (plf).
- Members evaluated for 300 lb. point load.

20 Double Top Chord Extension



Design criteria for details 19 and 20:

F_v = 175 psi
F_b = 2,100 psi
E = 1.8 x 10^6 psi

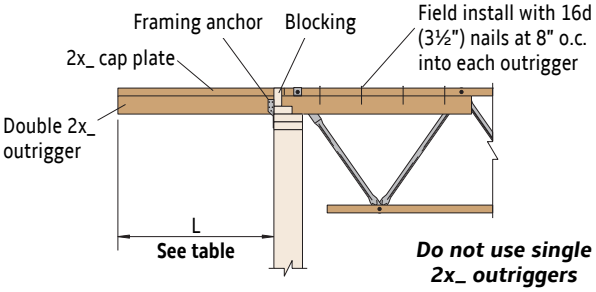
Deflection:

- 2L/360 at LL for floors (live load = 0.80 x total load)
- 2L/240 at TL for roofs

Length L	Allowable Uniform Load Capacity (plf)					
	Red-L™ Trusses			Red-W™ Trusses		
	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)
18"	375	425	460	455	500	515
20"	295	355	355	400	480	480
22"	220	265	265	300	360	360
24"	170	205	205	230	280	280
26"	135	160	160	180	220	220
28"				145	175	175
30"				120	145	145
32"				100	115	115

- Values are limited by the published backspan capacity (plf).
- Members evaluated for 300 lb. point load.

21 Double 2x_ Outrigger



Do not use single 2x_ outriggers

The following minimum criteria were used to develop the values:

2x4 and 2x6:
F_v = 175 psi
F_b = 2,100 psi
E = 1.8 x 10^6 psi

2x8:
F_v = 175 psi
F_b = 900 psi(1)
E = 1.6 x 10^6 psi

(1) Multiply by C_F=1.2

Outrigger deflection:

- 2L/360 at LL for floors (live load = 0.80 x total load)
- 2L/240 at TL for roofs
- Outrigger deflection = $\frac{WL^4}{8EI}$

Outrigger Length L	Allowable Uniform Load Capacity (plf)								
	Double 2x4 Outrigger			Double 2x6 Outrigger			Double 2x8 Outrigger		
	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)

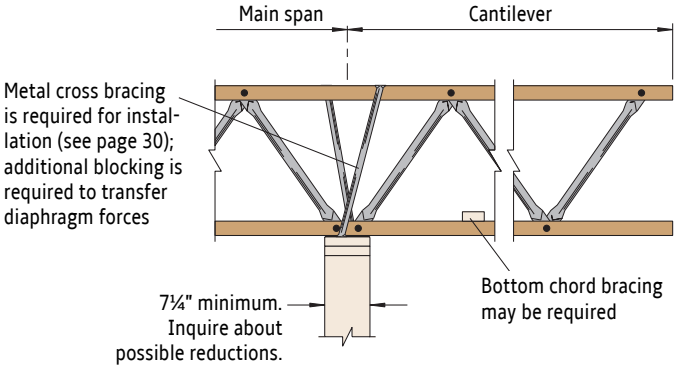
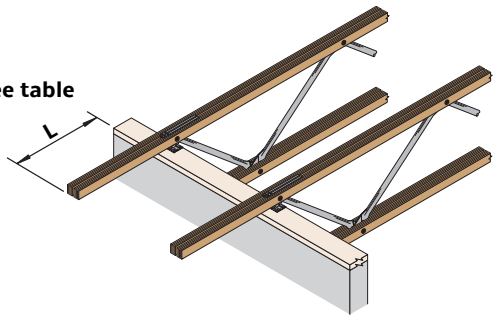
34 Bottom Chord Bearing Cantilever



To check cantilever capacity, contact your RedBuilt technical representative

35 Top Chord Extension



Length L	Chord Extension Capacity (plf)		
	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)
18"	290	330	360
20"	245	295	295
22"	195	235	235
24"	160	190	190
30"	90	110	110

- Values are limited by the published backspan capacity (plf).
- Members evaluated for 300 lb. point load.

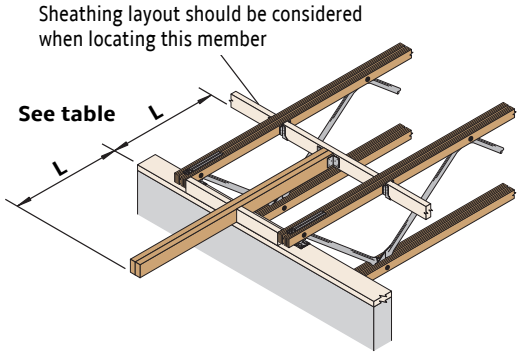
The following criteria were used to develop the values:

F_v = 285 psi
F_b = 3,000 psi(1)
E = 2.0 x 10^6 psi

(1) Multiply by size factor = 1.18

Deflection:
- 2L/360 at LL for floors (live load = 0.80 x total load)
- 2L/240 at TL for roofs

36 Double 2x_ Outrigger



Outriggers deeper than 2x4s require that spacer blocks be placed under the truss bearings

Outrigger Length L	Allowable Uniform Load Capacity (plf)								
	Double 2x4 Outrigger			Double 2x6 Outrigger			Double 2x8 Outrigger		
	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)	Floor (100%)	Snow Roof (115%)	Non-Snow Roof (125%)
24"	255	305	305	490	545	570	490	545	570
30"	160	190	190	490	545	570	490	545	570
36"	100	120	120	390	470	470	455	520	555
42"	65	80	80	260	315	315	385	445	475
48"	45	55	55	180	215	215	295	340	370
54"				130	155	155	235	270	290
60"				95	115	115	190	220	235
66"				70	85	85	145	175	175
72"				55	65	65	115	135	135
78"				45	55	55	90	110	110
84"				35	45	45	75	85	85
90"				30	35	35	60	70	70
96"					30	30		60	60

- Values are limited by the published backspan capacity (plf).
- All calculations assume a single 2x_ header of equal depth to the outriggers, with the trusses at 48" on-center.
- For single 2x_ outriggers, use half of allowable load shown for double outriggers.
- Members evaluated for 300 lb. point load.

The following criteria were used to develop the values:

2x4 and 2x6:
F_v = 175 psi
F_b = 2,100 psi
E = 1.8 x 10^6 psi

2x8:
F_v = 175 psi
F_b = 900 psi(1)
E = 1.6 x 10^6 psi

(1) Multiply by C_F=1.2

Outrigger deflection:
- 2L/360 at LL for floors (live load = 0.80 x total load)
- 2L/240 at TL for roofs
- Outrigger deflection = $\frac{7WL^4}{24EI} + \frac{48^2WL}{EI}$

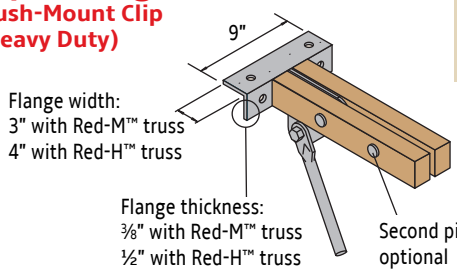
42 Top Bearing
Flush-Mount Clip (Heavy Duty)

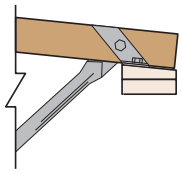
Specify for high axial load applications



Maximum slope is ½:12. Contact your RedBuilt technical representative for truss depths less than 31". See pages 24–26 for additional information on Wind or Seismic Connections.

See page 22 for bearing reaction capacities

43 Beveled Plate Requirements



Beveled plates serve two functions:
1. Provide proper bearing for bearing clips.
2. Avoid interference between top chords and bearing plate.

Slopes Requiring a Beveled Plate

Bearing Condition		S-Clip Z-Clip	Angle Clip T-Clip	P-Clip	Flush Mount
Low End	2x8	>1/8:12	>¼:12	N.A.	See detail 42

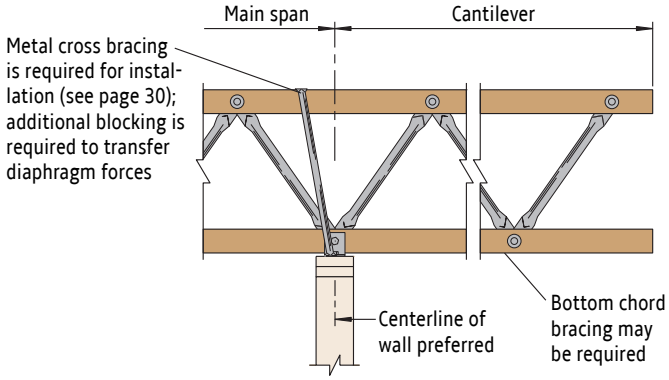
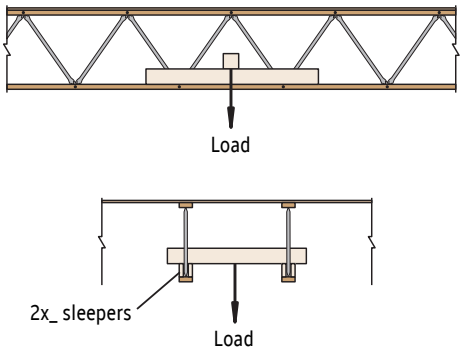
Contact your RedBuilt technical representative if cantilever exceeds ⅓ of the truss span

48 Bottom Chord Bearing Cantilever
T-Clip



Contact your RedBuilt technical representative if cantilever exceeds ⅓ of the truss span

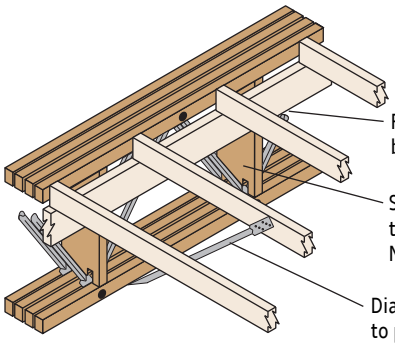
49 Concentrated Loads



Concentrated and Non-Uniform Loads

For the most efficient use of RedBuilt™ products carrying concentrated loads or non-uniform loads, and/or used in conditions other than simple spans, consult your RedBuilt technical representative for precise sizing. As a general rule, extra members should be added to the system to carry concentrated loads such as bearing partitions, air-conditioners, and other mechanical equipment. Handling concentrated loads in this manner usually provides the most economical system and also helps ensure more uniform deflection.

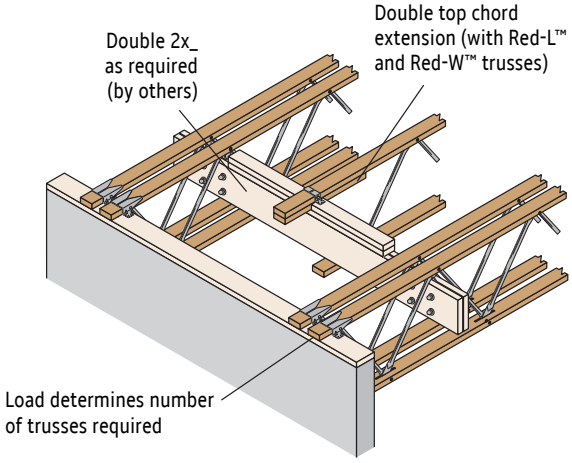
50 Side-Loaded Double Truss Assembly



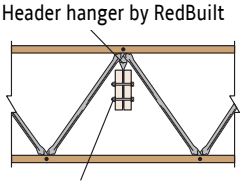
Load transfer blocks are required only when the load is imposed from the side

Truss Series	Maximum Load Per Transfer Block
Red-L™, Red-W™	700 lbs
Red-S™, Red-M™	1,200 lbs
Red-H™	1,300 lbs

51 Header Detail



Truss depth, design load, and web angle may limit header size. Check feasibility with your local RedBuilt technical representative.



Truss Series	Maximum Allowable Header Clip Load Per Truss			
	Single Truss		Double Truss	
	Reaction	Header Bolts Required	Reaction	Header Bolts Required
Red-L™ and Red-W™	2,190 lbs	2	2,740 lbs	4
Red-S™	4,170 lbs	4		
Red-M™	3,540 lbs	4		
Red-H™	9,640 lbs	4		

- Table values do not consider header or header connection designs.
- Table values are based on large truss pins. Contact your local RedBuilt technical representative to ensure that the truss application works with the corresponding header reaction.

(1) Increased bearing length is required when truss slope meets or exceeds ¼:12.

(2) Sloped applications may require longer bearing lengths.

(3) Use a Douglas fir bearing plate (or equivalent).

- Values are based on bearing plate material (with $F_{c\perp}$ = 405 psi, SG = 0.42) unless noted with (3).

Single- and Double-Chord Flush-Mount Bearing Clip Capacities

Truss Series	Detail Number	Bearing (Top or Bottom)	Bearing Length (min.)	Reaction Capacity (lbs) Allowable Bearing Plate Stress 405 psi	555 psi	600 psi	Steel (max.)	45° Skew (max.)

(1) Increased uplift capacities are available with clip modifications. Please contact your RedBuilt™ representative.

(2) Sloped applications may require longer bearing lengths.

(3) SD9112 Strong-Drive® wood screw by Simpson Strong-Tie.

- Capacity is based on load duration factor = 160%.
- Capacity is based on spruce-pine-fir bearing plate material (SG = 0.42).
- Please contact your RedBuilt representative for other bearing plate material or for capacity at other load durations.

(1) Minimum support width equals A + B (2 x A at bottom chord cantilever).
(2) Actual pin to end distance is based on forces in truss chord. Minimum cut-off may not be acceptable.
(3) Based on 2012 NDS® minimum end distance of 3.5D.
(4) P-Clip geometry is dependent on the starter web angle and top chord slope.

Legend
A = Face of support to centerline of bearing clip
B = Centerline of bearing clip to end of chord
C = Pin to end of chord
D = Bearing clip height
E = Pin to end of chord with vertical web

Wall and Strap Ties for Open-Web Trusses

Listed below is a small sample of the various nail-based straps and ties offered by Simpson Strong-Tie® Company Inc. Please consult their catalog or the USP Structural Connectors® catalog for additional options.

Strap Tension Tie Nailing and Allowable Tension Loads

Design Category	Maximum Ledger Size	Model No.	Non-Cracked Concrete			Cracked Concrete			CMU Wall

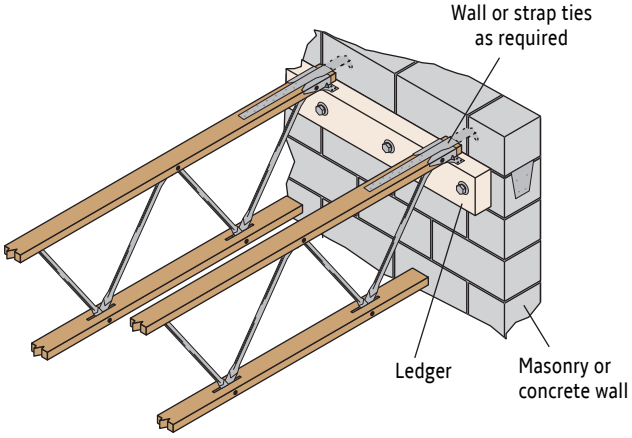
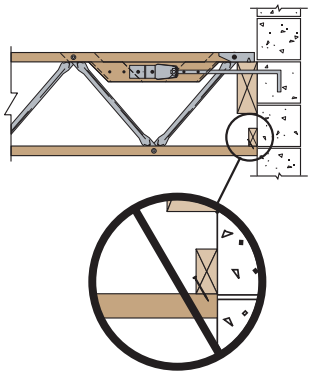
58 Wall and Strap Ties for Red-L,™ Red-W,™ Red-S,™ Red-M,™ and Red-H™ Trusses

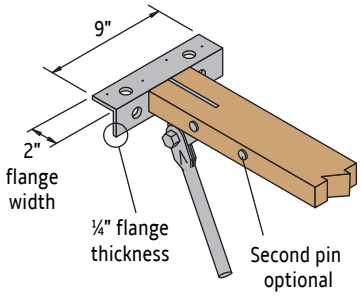




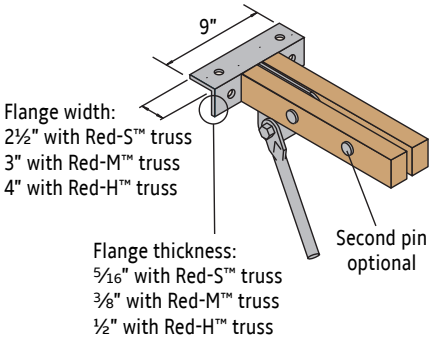
DO NOT attach bottom chord to wall when using any top chord bearing truss

Also see detail 6 on page 13 for more information.

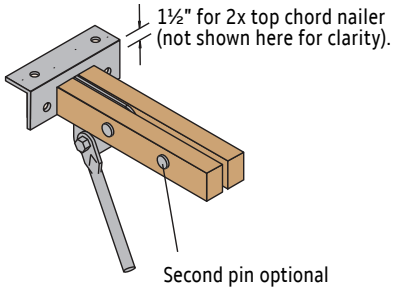
62 Single Chord Flush-Mount Bearing Clip



63 Double Chord Flush-Mount Bearing Clip



64 Double Chord Flush-Mount Bearing Clip with Nailer



Axial Tension or Compression Capacity

Truss Series	Capacity at 133% or 160% (lbs)	
	1 Pin	2 Pin
Red-L™	2,705	4,450
Red-W™	3,700	6,115
Red-S™(1)	4,320	8,125
Red-M™(1)	5,115	10,235
Red-H™(1)	6,325	12,220

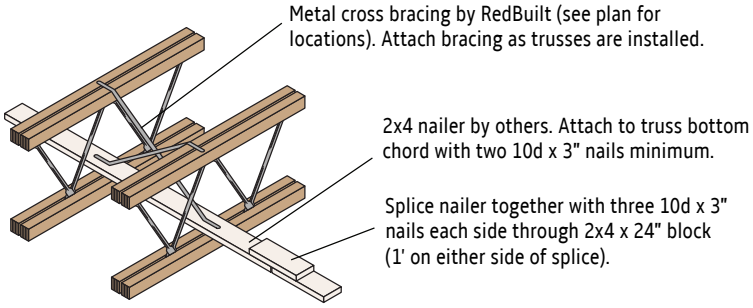
(1) With or without top chord nailer.

- Design professional of record shall provide attachment for clip to bearing.

WIND BRACING

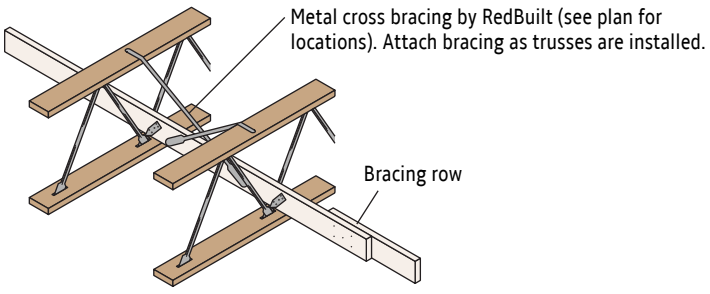
Truss bottom chord bracing may be required by building code provisions for wind uplift design when roof trusses do not have directly applied ceilings. Project engineer shall specify wind load; contact your RedBuilt representative for specific wind bracing stability requirements.

60 Cross Bracing with 2x4 Nailer



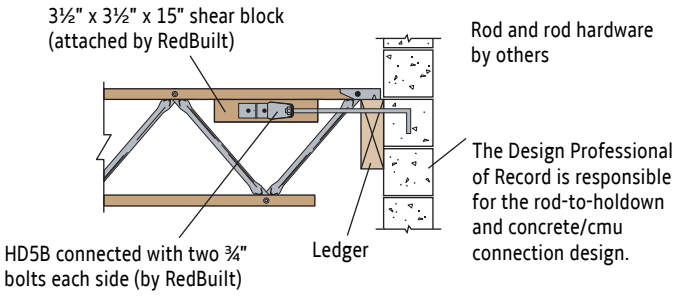
For wind bracing on Red-S™, Red-M™ and Red-H™ trusses. Cross bracing may not actually cross.

61 Cross Bracing with Bridging Row



For wind bracing on Red-L™ and Red-W™ trusses. Cross bracing may not actually cross.

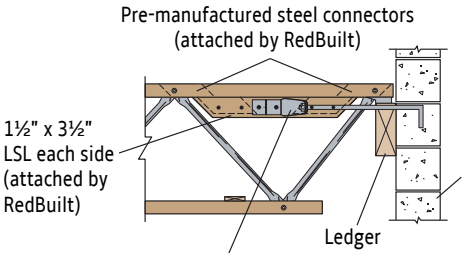
65 Red-L™ and Red-W™ Trusses with Shear Block



Maximum truss assembly tension capacity is 3,500 lbs at 160%. Truss geometry, especially at shallow depths, may limit capacity. Contact your RedBuilt technical representative for more information.

66 Red-L™, Red-W™, and Red-S™ Trusses with Steel Connector

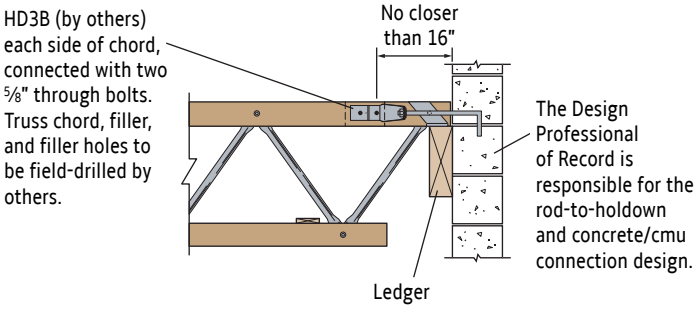
Red-S™ shown, others similar. 16" min. truss depth required.



- **Red-S™:** HD5B connected with two ¾" bolts each side (by RedBuilt).
- **Red-L™ or Red-W™:** HD3B connected with two ⅝" bolts each side (by RedBuilt)

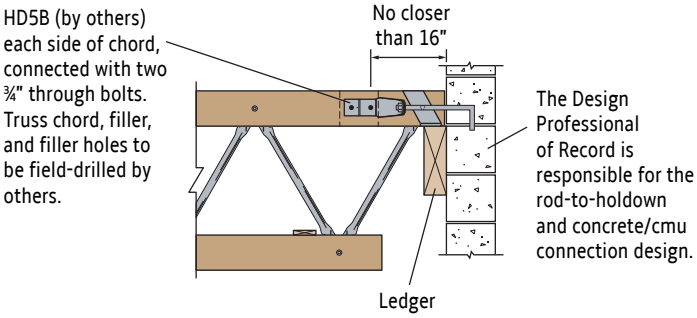
Maximum truss assembly tension capacity is 4,770 lbs for Red-L™ and Red-W™ trusses; and 7,120 lbs for Red-S™ trusses at 160%. Truss geometry may limit capacity. Contact your RedBuilt technical representative for more information.

67 Red-M™ Truss with Wall Tie



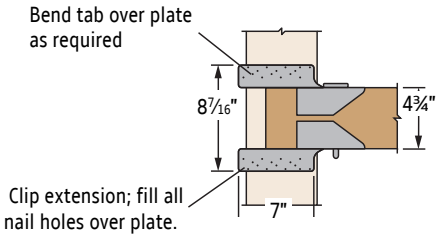
Maximum truss assembly tension capacity is 4,320 lbs with MSR chords and 4,770 lbs with RedLam™ LVL chords at 160%. Truss geometry may limit capacity. Contact your RedBuilt technical representative for more information.

68 Red-H™ Truss with Wall Tie



Maximum truss assembly tension capacity is 5,180 lbs with MSR chords and 7,120 lbs with RedLam™ LVL chords at 160%. Truss geometry may limit capacity. Contact your RedBuilt technical representative for more information.

69 Red-W™ Truss Top Chord Bearing
Lateral No-Notch Clip

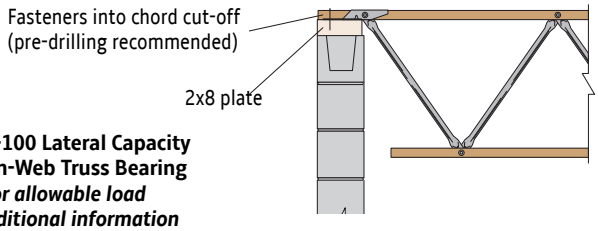


Lateral No-Notch Clip Allowable Loads (lbs)

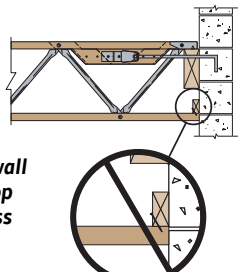
Bearing Plate	Thickness (min.)	Nail Size (min.)	Red-W™ Trusses		
			Lateral Load (160%)		
			Seismic Load	Wind Load	
				Net Uplift = 0 PSF	Net Uplift = 5 PSF
3½"	1½"	0.148" x 1½"	1,970	1,970	1,410
3½"	2½"	0.162" x 2½"	2,320	2,320	1,410
5½"	1½"	0.148" x 1½"	2,905	2,905	2,090
5½"	2½"	0.162" x 2½"	2,905	2,905	2,090
7¼"	1½"	0.148" x 1½"	2,905	2,905	2,625
7¼"	2½"	0.162" x 2½"	2,905	2,905	2,625

- Values are based on bearing plate width SG = 0.50. For SG = 0.42, multiply table values by 0.86.
- For other uplift loads, interpolation is permitted.

69A Red-L™ and Red-W™ Truss
Standard No-Notch Clip *(Alternate)*



See* TB-100 Lateral Capacity of Open-Web Truss Bearing Clips *for allowable load and additional information

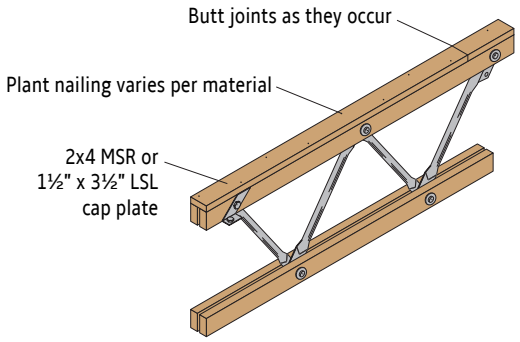


DO NOT attach bottom chord to wall when using any top chord bearing truss

70 RedBuilt™ Open-Web Truss with Cap Plate

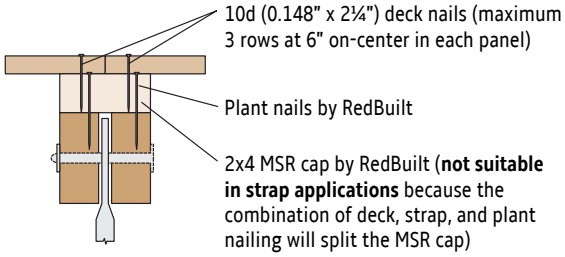
Cap plates provide the following functions:

- Transfer seismic/wind strap loads (LSL cap plate only).
- Enhance diaphragm nailing capabilities.
- Provide diaphragm shear transfer at continuous panel joints (required at all high shear diaphragms).
- Eliminate interference between subpurlins and truss pins in panelized roof systems.
- Required to provide adequate attachment base for structural insulated panels (SIPs) or Tectum deck applications.



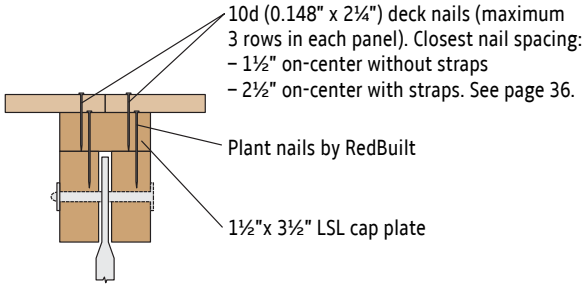
When uplift on cap plate-to-truss connection exceeds 104 plf, contact your RedBuilt representative

Sawn Lumber Cap Plate

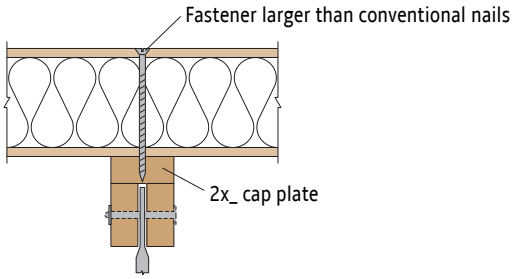


For diaphragm nails, use 2¼" maximum length deck nails to eliminate nail-spacing limitations with truss chords

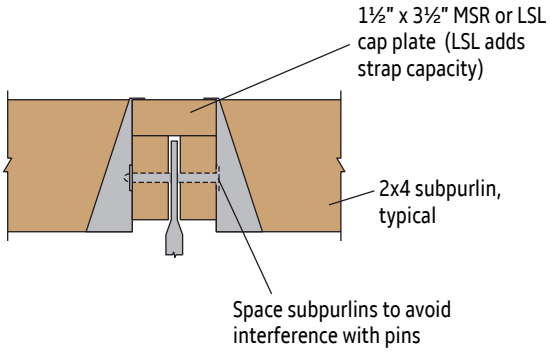
LSL Cap Plate (suitable for straps; see page 24)



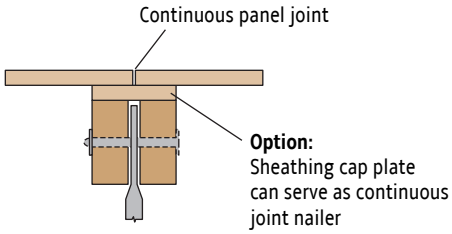
71 Double Chord Open-Web Truss with SIP or Tectum Panels



72 Typical Double Chord Open-Web Truss with 2x_ Subpurlin



73 Double Chord Open-Web Truss with Continuous Panel Joint



Nail spacing is limited by truss chords. See page 36.

BRIDGING

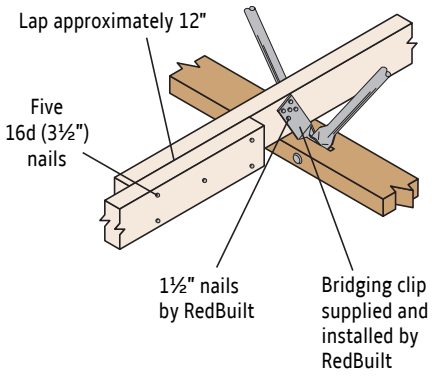
Bridging is used to make each truss act with those next to it (load sharing) and minimize or equalize deflections from non-uniform loads. Bridging should not be confused with bracing, which has a different purpose.

Roof Systems usually do not require bridging because differential deflections, vibrations, etc. are typically not a problem with roof systems. However, **bridging is required for load sharing with Red-L™ and Red-W™ trusses** because they have single-member chords and are commonly used in relatively long spans with wide on-center spacing.

Floor Systems perform better under typical loads—particularly with regard to deflection and vibration—if they have an effective bridging system.

Red-L™ and Red-W™ Trusses

Bridging is required for all floor and roof applications.



2x_ bridging is designed to transfer a 500 lb load. Field bend bridging clip approximately 30 degrees before nailing to bridging row.

Bridging must be attached to a minimum of three trusses

Bridging Rows

Truss Bridging	Span	No. of Rows
Roof Truss Bridging(1)(2)	≤ 16'	1
	> 16' to 35'	2
	> 35' to 55'	3
	> 55'	4
Floor Truss Bridging(2) Without a Directly Applied Ceiling	≤ 10'	1
	> 10' to 24'	2
	> 24' to 32'	3
	> 32'	4
Floor Truss Bridging(2) With a Directly Applied Ceiling	≤ 22'	1
	> 22' to 32'	2
	> 32' to 42'	3
	> 42'	4

(1) Additional bracing may be required when trusses are to be installed out of plumb greater than ¼:12. Contact your RedBuilt representative.

(2) Bridging is required in cantilevers when the length of cantilever exceeds three times the truss depth.

Sawn Lumber Bridging

Floor or Roof

Maximum On-Center Truss Spacing	Minimum Size of Continuous Bridging Member		
	Doug Fir #2	MSR 1650f–1.3E	MSR 2100f–1.8E
16"	2x4	2x4	2x4
19.2"	2x6	2x4	2x4
24"	2x6	2x6	2x4

General Notes

- Widths shown are the **minimum allowable openings based on heaviest loads (shortest panels).** Check with your RedBuilt representative for more precise sizing, including larger openings.
- Tables are applicable **only for uniform loads.**

For trusses designed for office floor conditions requiring concentrated loads, or for any other non-uniform loads, contact your RedBuilt representative.

INSTALLATION BRACING

Open-web trusses require installation bracing to prevent lateral buckling of the chord members until they are stabilized by connection to the sheathing and by permanent bracing of the completed structure (as designed). Installation bracing includes strut bracing rows, cross bracing at bottom chord bearing conditions, bottom chord restraint, and braced end wall or diaphragm restraint adequate to support the strut bracing rows. The criteria used for this installation bracing assume **either** of the following conditions:

- The truss carries its own weight plus the weight of applied sheathing and two 250-pound workers concentrated at ⅓ points of the span;

  OR

- An unloaded truss with a 30 mph wind

Bracing for construction loads equivalent to or beyond these loads is the responsibility of the installer. **Bracing must be installed as each truss is put in position.**

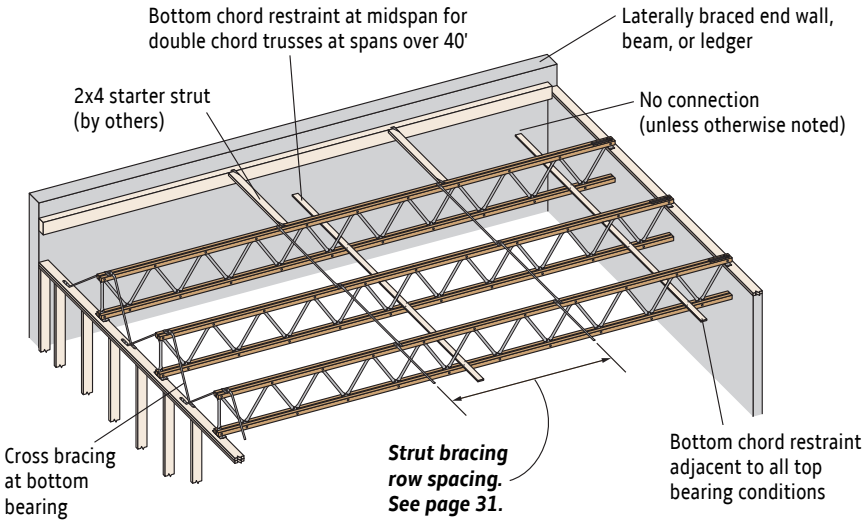
All trusses are laterally unstable until properly braced. The longer the span, the more care is required. Adequate restraint is necessary at all stages of construction.

Complete stability is not achieved until all bracing and decking is completely installed and properly fastened.

Installation bracing and procedures, as well as the safety of the workers, are the responsibility of the installer.

For more information, see RedBuilt's *Open-Web Truss Installation Guide* (available online at redbuilt.com).

Typical Application

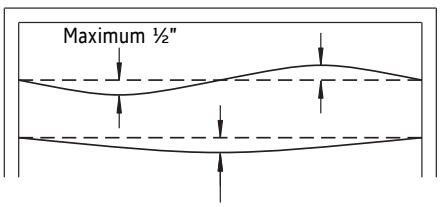


General Notes

- Bottom chord restraints are 1x4 (minimum) nailers and are attached to the top of the bottom chord with two 8d (2½") nails for double chord trusses only. Materials are to be provided by the installer.
- Bridging, when specified, may be used instead of bottom chord restraint.

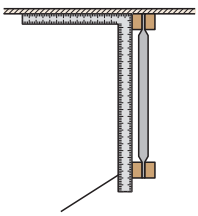
Permitted Installation Tolerances

Truss Chord Alignment Tolerance



To provide proper performance, trusses should not vary more than ½" from a straight line

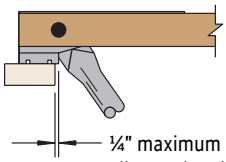
Vertical Alignment Tolerance



Bottom chord of truss should not be out of square with deck by more than ¼:12 of truss depth. Example: ½" for a 24" depth truss.

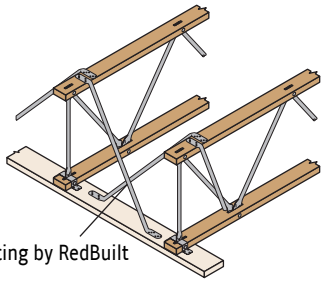
Overhang Tolerance at Bearing

(Red-S™ bearing shown)

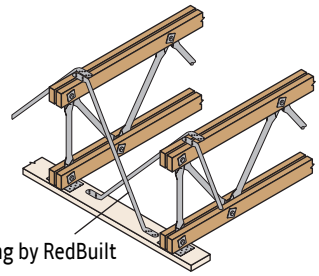


(1) ½" maximum overhang for Red-M™ series trusses with Z-Clip or P-Clip bearing hardware

Cross Bracing



Cross bracing by RedBuilt



Cross bracing by RedBuilt

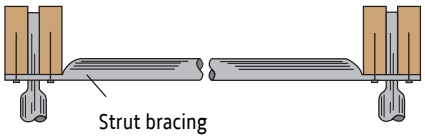
Cross bracing is provided for all open-web trusses at bottom chord bearing conditions. Install cross bracing as each truss is set. Maximum lateral load is 500 lbs per truss.

Strut Bracing

Installation bracing is required for all open-web truss applications. RedBuilt's recommended method for bracing is to use the strut bracing supplied by RedBuilt. Strut bracing rows should be spaced equally, per the on-center spacing noted in the **Required Spacing** table below. On roof systems, strut bracing is attached to the top of upper chord members. On floor systems it is attached to the bottom of the upper chord members to avoid interference with the direct attachment of sheathing. See detail below.

Roof Application

Floor Application



Maximum Number of Erected Trusses Before Sheathing is Required

Truss Series	Span				
	< 30'	< 40'	< 50'	< 60'	< 70'
Red-L™	40	27	21	17	14
Red-W™	40	27	21	17	14
Red-S™	29	20	15	12	10
Red-M™	20	14	11	8	7
Red-H™	14	9	7	6	5

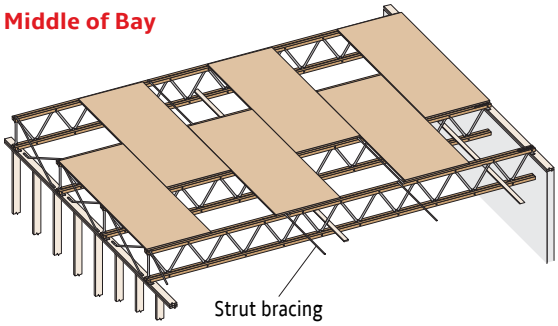
- Per bay of trusses.

Required Spacing

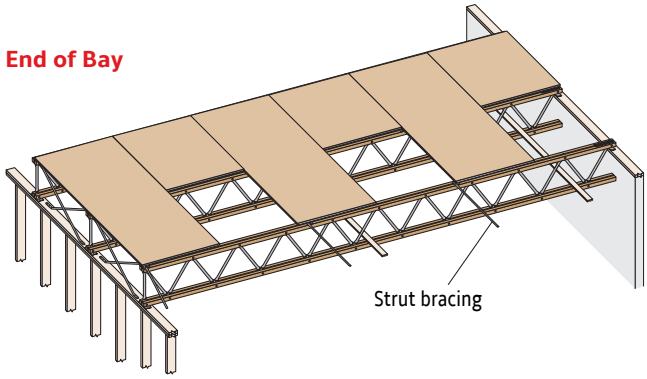
Truss Series	Strut Bracing Row Spacing
Red-S™	10' o.c.
Red-L™, Red-M™, and Red-H™	12' o.c.
Red-W™	14' o.c.

Starting Bracing—No Laterally Braced End Wall or Beam

Middle of Bay



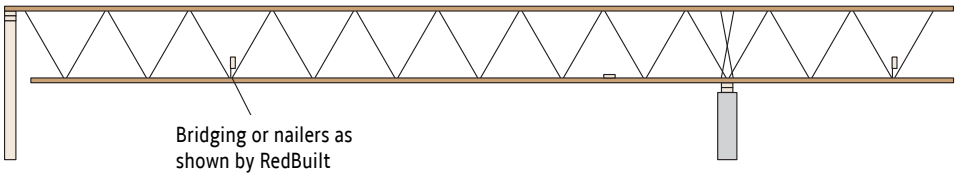
End of Bay



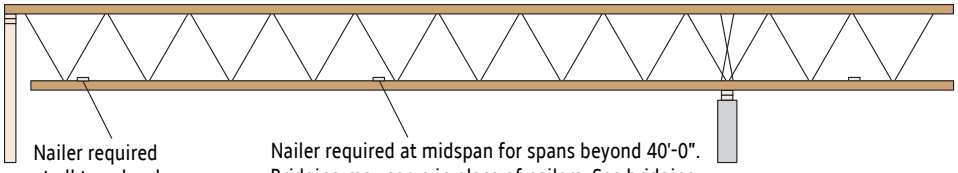
General Notes

- Installation bracing is required, strut bracing is supplied by RedBuilt. See spacing and sheathing requirements above.
- Sheath and nail per project architect, engineer, or local building code. See page 36 for allowable nailing into truss chords.

Bottom Chord Restraint for Red-S,™ Red-M,™ and Red-H™ Trusses



Attach 1x4 minimum nailer to top of bottom chord with two 8d (2½") nails in each chord member



General Notes

- Bottom chord restraint is required to stabilize the bottom chord and is typically provided by the installer.
- **Bracing may be required at cantilevers as determined by RedBuilt.**

Long Spans (Over 70 Feet)

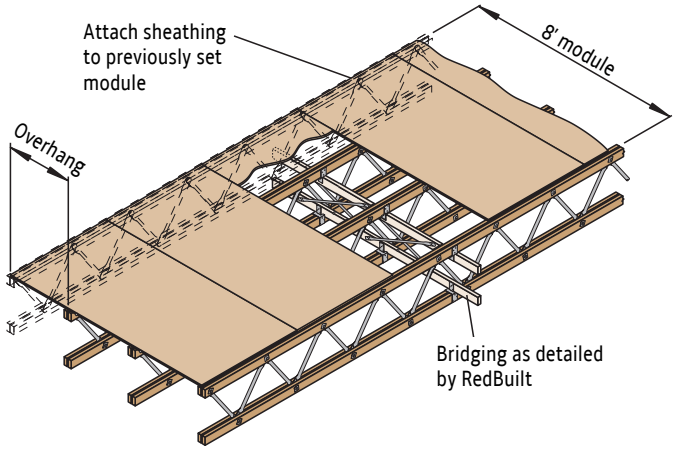
RedBuilt™ open-web trusses with spans over 70 feet are available only if all of the following additional requirements are satisfied. Review each of these requirements with your RedBuilt representative prior to sizing and detailing our products in any application involving spans beyond 70 feet.

1. There must be a responsible architect and/or engineer of record throughout the design and construction period of the project.
2. The responsible architect or engineer must include the following statement in the job specifications: ***"The trusses shall be installed in rigid modules at least 8 feet in width, accurately assembled in a jig with final sheathing permanently and totally attached while on the ground. Specified bridging shall be installed in each module as detailed."***
3. Only structural panel sheathing will be permitted.
4. The purchaser-contractor must sign an addendum to our standard purchase agreement that contains the above requirements.
5. Prior to execution of the purchase agreement, the specifications and details of the job must be submitted to and reviewed by RedBuilt engineering along with a description of the installation procedures proposed to be used. Review will be solely with respect to the above requirements.

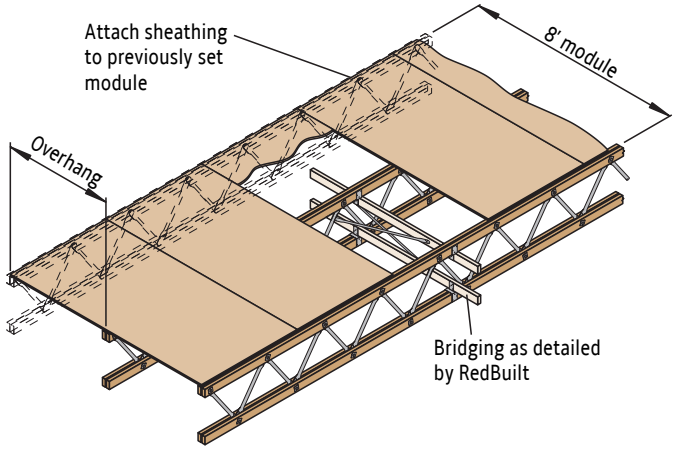
The sketches shown at right show possible rigid modules that would satisfy the condition specified in requirement 2 above.

Modules with Sheathing Overhang

Trusses at 32" On-center

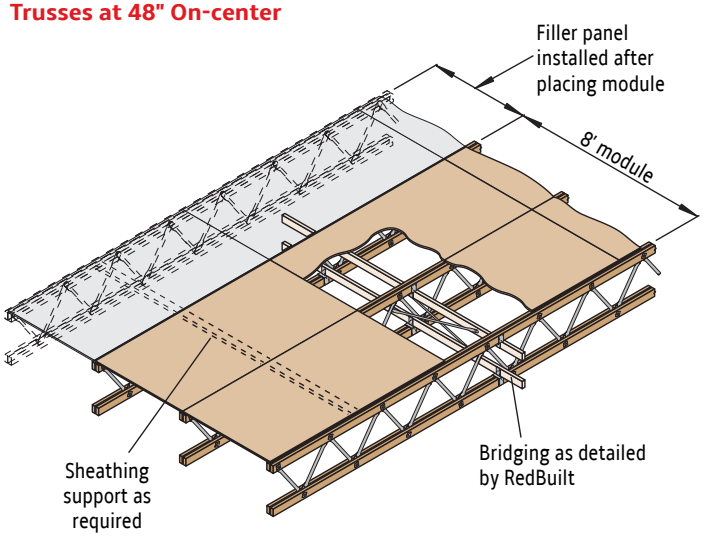


Trusses at 48" On-center



Module with Sheathing Filler Panel

Trusses at 48" On-center



A cap may be required over double chord open-web trusses where high shear loads are encountered

Refer to local building codes for live load design requirements.

Composition Roofing

2–15 and 1–90 lb . . . . . 1.7 psf
3–15 and 1–90 lb . . . . . 2.2 psf

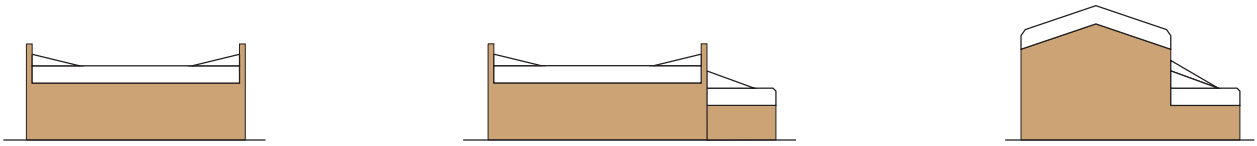
- PLF Unit Weight = (density) x (width) x (depth)

SNOWDRIFT LOADING



Wind direction, site exposure, and roof type and shape are some of the factors that can dramatically influence the accumulation of snow on a roof structure. ASCE 7 (*Minimum Design Loads for Buildings and Other Structures*) and the applicable building code, as well as other local state and regional codes, provide guidelines for calculating snowdrift loadings on all types of building construction.

Drifts usually occur at locations of discontinuity in a roof, such as at parapet walls, valleys, or where a high roof meets a low roof. Closer on-center spacing or additional support may be required at these locations.

The examples above illustrate potential snowdrift conditions. The project design professional is responsible for determining any additional loads due to snow drifting.

TECHNICAL SUPPORT AND ANALYSIS

Technical Support Organization and Functions

RedBuilt has four strategically located Design Centers staffed by professional engineers and designers. Their role is to provide technical support and service to our RedBuilt representatives, the professional design community, and the manufacturing plants. Design Center personnel have access to extensive test data, production standards, building code product acceptance criteria, and the most current computer design software.

The Design Centers work closely with our RedBuilt representatives and can provide the following services:

- Review and analysis of potential applications submitted by our RedBuilt representatives
- Drawings showing placement, bearing conditions, dimensions, and installation suggestions
- Custom design of the product
- Assistance in resolving field problems should they arise

This design guide contains technical data and design information frequently required by the design professional when using our products. Because of the variety of possible conditions, the design professional is strongly encouraged to request support from RedBuilt Design Centers through one of our representatives.

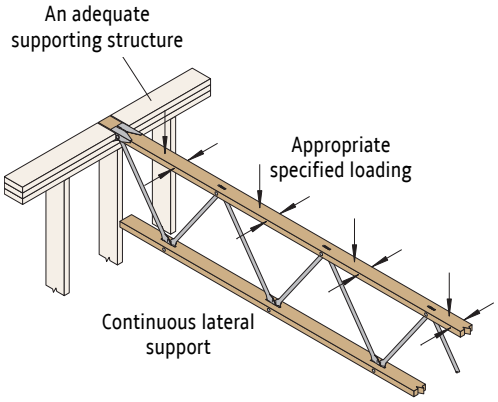
Product Application Assumptions

Our warranty is subject to an adequate supporting structure for our products. The design of the entire structure is not the role of RedBuilt, nor can we assume accountability for the full function of the roof or floor system. We can only be responsible for the internal design integrity of our own products, which are structural components of roof and floor systems that are necessarily designed by others.

Our warranty is also subject to continuous lateral support to the compression chord of our products unless specific design provisions account for other lateral support conditions. Continuous lateral support is provided by 8d (2½") nails at 24" on-center (minimum) for Red-L™ and Red-W™ trusses; and by 8d (2½") nails at 12" on-center (minimum), staggered, to each of the double chord members for Red-S™, Red-M™, and Red-H™ trusses; all connected to an adequate diaphragm or total lateral strength system.

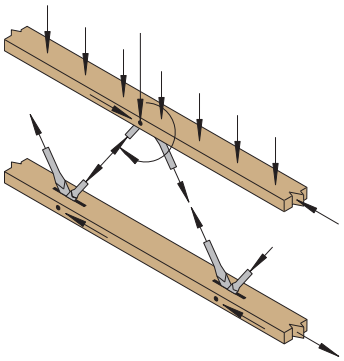
The magnitude, direction, and location of all design loads are as specified by the building designer. The review of this loading by our personnel is only for purposes of designing our product.

Other application assumptions are referenced on the terms and conditions of our purchase agreement contract.



Analysis Procedure

RedBuilt™ open-web trusses are analyzed as pin-connected trusses with continuity in the top chord member, which receives the superimposed loading. Allowable truss-member forces are designated in the product acceptance criteria or derived from material stresses therein. Chord members are analyzed considering both net section at panel points and gross sections between the panels. Allowable web member forces consider gross and net sections, pin bearing and buckling. Pin-connection details consider allowable bearing in the wood for both parallel and perpendicular-to-grain direction. Reaction detail analysis includes allowable bearing, induced moments where applicable, and detail stresses. Stress and deflection are calculated by the displacement method. All of the above is substantiated through continual testing.



RedBuilt Recommended Deflection Criteria

Full-scale tests have shown repeatedly that RedBuilt™ products have deflection characteristics that are consistently predictable by calculation, with minimal set after load withdrawal.

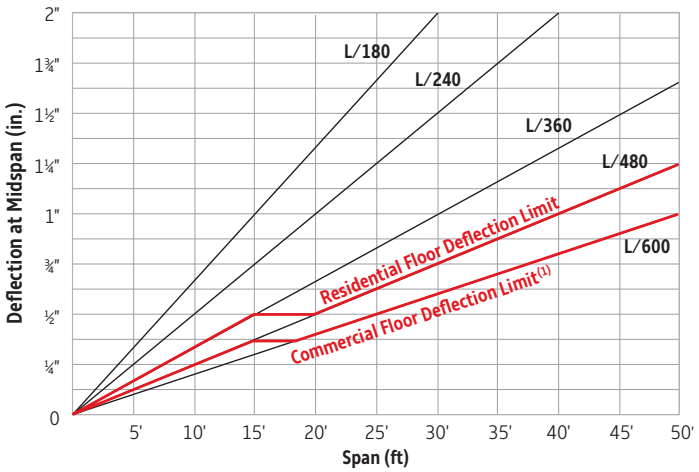
The graph below shows that RedBuilt's recommended deflection limit for residential and commercial floors is more restrictive than the minimum required by typical building codes. The floor load tables shown on pages 6–11 were developed based on the **Commercial Floor Deflection Limit** shown in the graph below.

Floors:

- Maximum deflection at live load limited as indicated below
- Movable partition loads need not be considered

Roofs:

- Sloped Roofs—¼" to 12" per foot, maximum deflection L/180 at total load
- Plaster Ceilings—Also check L/360 at live load



(1) For live load applications greater than 50 psf, check the L/600 deflection limit using a 50 psf live load, and check the code-prescribed deflection limit using the full live load.

Deflection criteria will vary by application. In a roof system, excessive deflection would be unsightly and could cause ceiling cracks and/or drainage problems. Floor systems, however, have entirely different—and usually much more restrictive—deflection requirements due to an occupant's perception of floor performance and feel.

The fundamental frequency of a floor system can be a good predictor of performance. Contact RedBuilt to discuss floor system performance for applications that are sensitive to vibration.

Deflection Calculations

Deflections for open-web trusses can be closely approximated by standard beam formulas, assuming that the chord members act as the resistance to deflection with the modulus of elasticity (E) of the chords adjusted to allow for the deflection of the webs. Thus, the product of the moment of inertia (I) and the effective modulus of elasticity (E) is as shown in the **Truss Rigidity Properties** table below.

For uniformly loaded simple spans, the mid-span deflection (in inches) becomes:

$$\Delta = \frac{22.5wL^4}{EI}$$

Where:

w = Uniform load in plf
L = Span in feet
d = The average pin-to-pin depth of the truss in inches, which is the average depth of the truss minus the following:

Red-L™ and Red-W™ trusses. . . . . 1.5 inches
Red-S™ trusses. . . . . 2.3 inches
Red-M™ trusses . . . . . 3.5 inches
Red-H™ trusses . . . . . 5.5 inches

Truss Rigidity Properties

Truss Series	EI Truss Only (Roof)	EI Nailed Floor	EI Glue-Nailed Floor
Red-L™	5.26 x 10^6d^2	5.69 x 10^6d^2	6.03 x 10^6d^2
Red-W™	6.78 x 10^6d^2	7.20 x 10^6d^2	7.54 x 10^6d^2
Red-S™	6.94 x 10^6d^2	7.41 x 10^6d^2	7.79 x 10^6d^2
Red-M™	10.06 x 10^6d^2	10.60 x 10^6d^2	11.02 x 10^6d^2
Red-H™	15.93 x 10^6d^2	16.54 x 10^6d^2	17.03 x 10^6d^2

CAMBER CRITERIA

The manufacture of RedBuilt™ open-web trusses includes the ability to provide a specified camber for appearance. Camber must be considered on an individual job basis, although certain policies derived from successful experiences are indicated. If camber is not specified in the order, our policy and considerations of other related job information will be used by our design department toward its selection.

Although excessive camber in any product may cause problems in framing, it is recommended that these policies be followed closely to avoid the serious problems caused by inadequate camber. In the case of flat roofs, the camber policy will be strictly adhered to unless it is shown that an adequate drainage system is provided to avoid ponding water and the resulting overloads.

Camber selection in structural members should include consideration for matching requirements of adjacent members of different length, as well as cantilevers meeting at a common elevation. In addition, consideration should be given to concentrated loads, non-load bearing walls, and special drainage problems. A RedBuilt representative is available to assist you in developing the camber requirements.

Recommended Camber for Floor and Roof

Loading Condition	Application	Recommended Camber	Minimum Recommended Camber
Snow Roof	Sloped Roofs (¼:12 min.)	DL Δ + ½ LL Δ	DL Δ + ¼ LL Δ
	Flat Roofs	TL	DL Δ + ½ LL Δ
Non-Snow Roof	All Roofs	1½ DL Δ	1¼ DL Δ
Floor	All Floors	1½ DL Δ	DL Δ

DL Δ = Dead load deflection
LL Δ = Live load deflection

Note: Movable partition loads are not to be considered in this policy.

NAILING INFORMATION

Minimum Nail Spacing

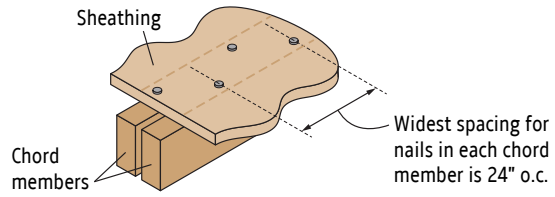
Nail Type	Nail Size	RedLam™ LVL			Sawn Lumber	
		Face	Edge		Face	Edge
			Truss Chord	Rim Board, Header, Beam		
8d[1]	0.113" x 2½"	2"	4"	3"	4"	2"
	0.131" x 2½"	2"	6"	3"	6"	2"
10d	0.128" x 3"	2"	6"	3"	6"	2"
	0.148" x 3"	3"	6"	4"[2]	6"	2½"
12d	0.128" x 3¼"	2"	6"	3"	6"	2"
	0.148" x 3¼"	3"	6"	4"[2]	6"	2½"
16d	0.135" x 3½"	3"	6"	4"	6"	2½"
	0.148" x 3¼"	3"	6"	4"[2]	6"	2½"
	0.162" x 3½"	4"	8"	8"[3]	8"	4"

(1) 14 gauge staples may be a direct substitute for 8d nails if a minimum penetration of 1" into the flange is maintained.

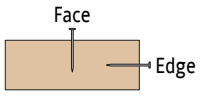
(2) Minimum spacing must be 5" for four rows of nails.

(3) Spacing may be reduced to 5" where nail penetration does not exceed 1⅜".

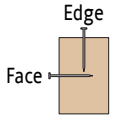
- If more than one row of nails is used, offset rows at least ½" and stagger. Maintain ⅜" minimum edge distance.
- Nailing pattern to be per plans and specifications, and nail spacing should comply with criteria listed on this page.
- For member stability, nail sheathing to the full length of the member (24" on-center, maximum).



Do not use nails smaller than 8d (2½") or larger than 16d (3½")



Flatwise orientation
(typical with Red-L™ and Red-W™ trusses and plywood edge blocking)



Edgewise orientation
(typical with Red-S™, Red-M™, and Red-H™ trusses and rim board, beams, and headers)

Refer to building code for allowable shear for wood diaphragms and the nail spacing requirements shown above.

SOUND DETAILS

Fire Assembly Details

For Fire Assemblies and other construction-related fire information, please refer to resources on our website at redbuilt.com.

Sound Assemblies and Noise Measurement

The ability of a wall or floor/ceiling system to reduce airborne sound transmission is measured using ASTM E90, and reported using the ASTM E413 Sound Transmission Class (STC) rating system. The ratings listed below—originally developed by the Acoustical and Insulation Materials Association and now considered a standard throughout the industry—are a practical reference for a range of STC numbers. In general, the higher the number, the better the acoustical performance. It is important to note that this table is valid only for a given level of background noise and should be used only for generalized comparisons.

Floor/ceiling systems can also be rated for impact noise transmitted through an assembly. Ratings are determined using the ASTM E492 Impact Insulation Class (IIC) system, and like STC ratings, a high IIC rating indicates significantly reduced impact noise.

STC Ratings

25	Normal speech can be understood quite clearly
30	Loud speech can be understood fairly well
35	Loud speech audible but not intelligible
42	Loud speech audible as a murmur
45	Must strain to hear loud speech
48	Some loud speech barely audible
50	Loud speech not audible

Testing

The acoustical assemblies provided below and on page 37 have been tested and rated by recognized acoustical laboratories, and the ratings shown are well within the acceptable range for multi-family buildings. However, in order to achieve these ratings, precautions should be taken to prevent flanking noise and sound leaks, and to ensure that actual construction conforms to the assembly shown.

Q1: How do I develop the most cost effective solution when using open-web trusses?

A1: The open-web truss load tables show the maximum load-carrying capacity of a given truss, but not necessarily the most cost-effective truss type or depth for the application. You can also use the **Specifying Economical Trusses** section on page 4 of this guide or you can contact your local RedBuilt representative at 1-866-859-6757 for assistance in finding the most economical solution for your application.

Q2: Can RedBuilt™ open-web trusses be used as drag struts?

A2: Yes. RedBuilt can design the chords of open-web trusses for specific axial loads. These loads must be provided by the design professional.

Q3: What is MSR lumber?

A3: Machine stress rated (MSR) lumber refers to sawn lumber that is mechanically evaluated for strength and stiffness, and then visually graded. Sawn lumber that is rated as MSR is regarded as high-quality material, and MSR is the only grade of sawn lumber used by RedBuilt in open-web truss chord components.

Q4: Are your open-web trusses covered by a warranty?

A4: Yes. RedBuilt warrants that its products will be free from manufacturing errors or defects in workmanship and material. In addition, provided that the product is correctly installed and used, the company warrants the adequacy of its design for the normal and expected life of the building. A copy of the warranty can be found on the back cover of this guide or on our website at www.RedBuilt.com.

Q5: Does RedBuilt provide any sprinkler system or fire-rated assembly details?

A5: Yes. RedBuilt provides a number of sprinkler system suspension and fire assembly details in AutoCAD® format, which can be downloaded from our website at redbuilt.com on the **AutoCAD Details** page.

Q6: What type of certification and quality assurance do open-web trusses have?

A6: RedBuilt™ open-web trusses are manufactured in accordance with rigorous standards, and they are monitored by a third-party quality control agency (PFS Corporation). These standards are modeled after ISO 9000.

Q7: How can I contact a RedBuilt representative?

A7: You can find your local RedBuilt representative by calling 1-866-859-6757 or visiting our website at redbuilt.com.

Q8: Can I modify or repair RedBuilt™ open-web trusses?

A8: On rare occasions, repairs or modifications can be made to RedBuilt™ open-web products—but only if the materials and instructions are provided by RedBuilt. Contact your local RedBuilt representative for more information or call 1-866-859-6757.

Q9: Can I treat open-web products with fire-retardant or preservative?

A9: RedBuilt does not recommend or warrant the use of field-applied treatments. The use of these products may reduce the design load-carrying capacity of the members. Instead, RedBuilt requires that dry-use conditions be maintained.

Q10: Why are some RedBuilt™ open-web trusses painted red on one end?

A10: Many truss applications require the use of non-symmetrical trusses. Typically this is due to non-uniform design loading patterns. Non-symmetrical trusses are marked with red paint on one end, and the layout drawings provided by RedBuilt will specify where the red end is to be installed.

Q11: Do RedBuilt™ open-web trusses meet the requirements set forth in the U.S. Green Building Council's (USGBC) Leadership in Energy and Environmental Design (LEED) standard?

A11: LEED–NC (new construction) is a commonly used building rating system designed to accelerate the development of green building practice. While products such as RedBuilt™ open-web trusses are not LEED certified on an individual basis, they may contribute to point totals for a "whole building" certification. For example, the following items may be viewed as contributors toward points in the LEED rating system:

- The **Low Emitting Materials** section (EQ 4.4) recognizes composite wood that is free from urea-formaldehyde resins. RedBuilt does not use urea-formaldehyde resins in any of its engineered lumber products. Material Safety Data Sheets (MSDS) are available at redbuilt.com.
- RedBuilt™ products may qualify for **Regional Materials (MR 5.1 and 5.2)** for projects located within a 500 mile radius of Portland, OR.
- Tubular steel webs and bearing clips used in RedBuilt open-web trusses may qualify for **Recycled Content (RC 4.1 and 4.2)**. For more information consult your RedBuilt technical representative.

1.0 General

1.1 Scope
This work includes the complete furnishings and installation of all RedBuilt™ open-web trusses, as shown on the drawings herein specified and necessary to complete the work.

1.2 Code Approvals
These products shall be designed and manufactured to the standards set forth in the International Code Council Report No. ESR-1774.

1.3 Related Work Specified Elsewhere
A. Carpentry and millwork
B. Glu-laminated members

1.4 Design
A. Products: RedBuilt™ products shall be designed to fit the dimensions and loads indicated on the plans.

B. Design Calculations: When requested, a complete set of design calculations shall be prepared by RedBuilt.

1.5 Submittals
A. Drawings: Drawings showing layout and detail necessary for determining fit and placement in the building shall be provided by RedBuilt.

B. Production: Fabrication and/or cutting shall not proceed until the architect and/or engineer have approved the submittal package.

2.0 Products

2.1 Materials
Materials shall comply with ICC-ES Report No. ESR-1774. Chord members, web members, connecting pins and bearing hardware/attachments shall be of material and size as required by design.

2.2 Fabrication
The trusses shall be manufactured by RedBuilt in a plant listed in the report referred to above and under the supervision of an approved third-party inspection agency.

2.3 Tolerances
Length, bearing-to-bearing:
For trusses up to 30 ft: ±1/8"
For trusses greater than 30 ft: ±1/4"
Depth: ±1/8"

CAMBER

Span	Individual Truss Tolerance Variation from Design	Variation Between Any Two Trusses of the Same Type
0 to 30'	±1/8"	1/4"
>30' to 60'	±3/8"	1/4"
>60' to 120'	±1/2"	1/2"

2.4 Identification
Each of the trusses shall be identified by a stamp indicating the truss series, ICC-ES report number, manufacturer's name, plant number, date of fabrication, and the independent inspection agency's logo.

2.5 Hardware
Not applicable.

3.0 Execution

3.1 Installation
RedBuilt™ open-web trusses, if stored prior to installation, shall be stored in a vertical position and protected from the weather. They shall be handled with care so they are not damaged. The open-web trusses shall be installed in accordance with the plans and any RedBuilt drawings and installation suggestions. Temporary construction loads that cause stresses beyond design limits are not permitted. Installation bracing is required to keep trusses straight and plumb, and to ensure adequate lateral support for the individual trusses and the entire system until the sheathing material has been applied. RedBuilt's recommended method for bracing is to use the strut bracing supplied by RedBuilt.

3.2 Installation Review
Prior to enclosing the trusses, the Contractor shall give notification to the RedBuilt representative to provide an opportunity for review of the installation.

3.3 Performance Standards
Not applicable.

3.4 Fire Rating/Sound Rating
Fire and sound ratings are to be established in accordance with the assemblies detailed in ICC-ES Report No. ESR-1774, or the *Directory of Listed Products* published by Intertek Testing Services.

3.5 Warranty
The products delivered shall be free from manufacturing errors or defects in workmanship and material. The products, when correctly installed and maintained, shall be warranted to perform as designed for the normal and expected life of the building.

4.0 Alternates and/or Equals

4.1 Base Bid
Due to the customized detailing and engineering characteristics of the roof and/or floor framing assembly, it is a requirement that open-web trusses be used in the base bid.

4.2 Alternate Manufacturers
Other manufacturers' bids are to be listed in the alternate section of your proposal. All framing plans, detailing, and calculations for the alternate bids will be reviewed by the owner, architect, and engineer for structural performance, possible conflicts with related trades, and compatibility with the overall building requirements and building code.

4.3 Alternate Products
Alternate products will only be permitted if written approval and acceptance is obtained by both architect and owner at least seven days prior to the bid date. Any monetary savings that may be realized by using an alternate product shall be forwarded to the owner.

4.4 Acceptable Alternatives
At the discretion of the specifier of record, accepted alternates will be listed on the final addendum prior to the bid date.

SERVICE AND SUPPORT YOU CAN COUNT ON.

RedBuilt is committed to creating superior structural solutions. How? By offering efficient structural building products supported by a broad range of services.

- Our team of RedBuilt representatives—one of the industry's largest—isn't afraid to get its hands dirty. We can help with technical information, installation questions or code compliance.
- At RedBuilt, our goal is to help you build solid and durable structures. A limited warranty for our products is in effect for the expected life of the building.
- Call us with a problem that you believe may be caused by our products, and our representative will contact you within one business day to evaluate the problem and help solve it—**GUARANTEED.**
